

Appendix A

Ambient Air Quality Data and Analysis

This page intentionally blank.

Appendix A: Ambient Air Quality Data and Analysis

A.1 INTRODUCTION

This Appendix provides 2004-2006 PM_{2.5} data analysis, a description of the PM_{2.5} attainment calculation process, 1999-2006 trends analysis, and ambient PM_{2.5} air quality data. This information supplements the overview of ambient PM_{2.5} data included in Chapter 1.

A.2 OVERVIEW OF RESULTS: 2004-2006 ANNUAL AND 24-HOUR PM_{2.5} AVERAGES

Air quality meets the 24-hour PM_{2.5} standard when the 3-year average of the annual 98th percentile PM_{2.5} value is less than or equal to 65 µg/m³ at each monitoring site. “Daily value” for PM refers to the 24-hour average concentration of PM calculated or measured from midnight to midnight (local standard time) for PM_{2.5}. Average and mean refer to an arithmetic mean. All the San Joaquin Valley (SJV) air monitoring sites meet the 24 hour “1997” PM_{2.5} NAAQS (Table A-1).

Air quality meets the annual PM_{2.5} standard whenever the 3-year average of the annual mean PM_{2.5} concentrations is less than or equal to 15.0 µg/m³. Most of the SJVAPCD sites PM_{2.5} monitors are above the annual mean PM_{2.5} NAAQS (Table A-2).

See Section A.3 of this appendix for information on how these calculations are completed, and see Section A.4 for data analysis from 1999-2006.

Table A-1 SJV PM_{2.5} 98th Percentile Value, 2004-2006, (µg/m³)

SJV SITE	2004	2005	2006	AVG. 04-06
Stockton	36.0	44.0	42.0	41
Modesto	45.0	55.0	52.0	51
Merced	43.0	48.3	43.8	45
Fresno-1st	52.0	71.0	51.0	58

Bakersfield-Golden	18.1	18.9	18.6	18.5
Bakersfield-California	19.0	17.9	18.7	18.5
Bakersfield-Planz	17.4	19.9	19.3	18.9

Annual average considered valid (Each Q>11 Samples and Annual Avg >Standard) but does not meet the 75% completeness requirement.

A.3 PM_{2.5} ANNUAL AND 24-HOUR ATTAINMENT STATUS CALCULATIONS

The San Joaquin Valley Unified Air Pollution Control District (District) calculated the Valley's attainment status according to the requirements of the U. S. Environmental Protection Agency's (EPA) April 1999 document, Guideline on Data Handling Conventions for the PM NAAQS, and Appendix N of 40 Code of Federal Regulations (CFR) part 50. PM_{2.5} values are calculated under both the annual and 24-hour NAAQS for each PM_{2.5} air quality-monitoring site that uses a federal reference method (FRM) monitor. There are 11 such air quality-monitoring sites¹ in the eight-county Valley: at least one monitor in each county except Madera and three monitoring sites in both Kern and Fresno Counties due to their large population concentrations (in Bakersfield and Fresno/Clovis respectively). On March 21, 2007, District staff downloaded the data from EPA's Air Quality System (AQS) website, the official repository for ambient air quality data (see Table 8 at the end of this Appendix). From this data, the District calculated the 2004 – 2006 daily and annual PM_{2.5} values accounting for the following:

- Rounding conventions
- Data completeness
- Varying sampling schedules
- Data validity flags

¹ For more details on the San Joaquin Valley air monitoring sites, refer to San Joaquin Valley Air Pollution Control District Ambient Air Monitoring Network Plan, May 29, 2007, <http://www.valleyair.org/notices/Docs/05-29-07/AMNPlanComment.pdf>.

A.3.1 Rounding Conventions

The starting point for annual and 24-hour PM_{2.5} averages is the ambient air quality data collected from the EPA-approved monitoring network operated in the San Joaquin Valley. The recorded concentrations are entered with one decimal place, and any other decimal places are truncated, not rounded (so 18.29 becomes 18.2, not 18.3). As the calculations are carried out (as described throughout this appendix), all of the available decimal places are retained until the final result is determined. Then, final annual PM_{2.5} averages are rounded to the nearest 0.1 µg/m³ (so 0.05 µg/m³ is rounded to 0.1 µg/m³). Final 24-hour PM_{2.5} averages are rounded to the nearest 1 µg/m³ (so 0.5 µg/m³ is rounded to 1 µg/m³).

A.3.2 Data Completeness

The data completeness test is performed for each site prior to calculating the 98th Percentile and Annual Mean PM_{2.5} values to ensure that each site has enough values to be compared to the NAAQS. A site meets the data completeness test when at least 75% of the scheduled sampling days for each quarter have valid data. The data completeness requirements for calculating the PM_{2.5} Annual Mean differ from the 24-Hour Daily PM_{2.5} Value.

For the annual PM_{2.5} values, on a site-by-site basis, the annual mean for that year and site is valid if each quarter has at least 75% of the scheduled sample days. For annual average calculations, quarters with at least 11 samples but less than 75 percent data completeness are included in the computation if the resulting annual average is greater than the level of the NAAQS, even though that site does not have a valid data for the year. No data is substituted for missing data. This method allows for nonattainment determinations, but cannot be used to prove attainment.

For the 98th percentile PM_{2.5} values, when less than 75% of the amount of valid data that should have been yielded from a quarter's scheduled sampling days is available, 40 CFR Part 50 Appendix N allows for estimation of missing values provided that the following requirements must be met:

- First, the site must have valid data for at least 50% of the scheduled number of samples for each quarter for all three years.
- The emissions and meteorology for the quarters to be substituted must be comparable to the emissions and meteorology for the quarters in question.

Once the above criteria are met, two approaches can be used to fill in for missing scheduled sampling days:

- Replace the missing data with collocated data from the same site and day, if such data is available.

- When there is no data from the same site and the same day, replace the missing data with the maximum concentration recorded at the site during the same quarter over the three-year period in question.

Table A-3 shows the data completeness of the PM_{2.5} values by quarter from 2004 through 2006. Since the data for some sites were incomplete, Table A-4 shows the substitutions for the 2004 through 2006 dataset.

Table A-3 Data Completeness by Quarter, 2004 – 2006, as Percentages

Site	2004				2005				2006			
	1	2	3	4	1	2	3	4	1	2	3	4

Collected data is less than 75 % complete.

Table A-4 Data Substitution for 98th Percentile Calculations, 2004-2006

Air monitoring site	Incomplete quarter	Substituted value	Substituted maximum value from	How many times substituted
Bakersfield - Planz	2 nd Qtr. 2006	30.6 µg/m ³	2 nd Qtr. 2005	16 times
Bakersfield - Planz	4 th Qtr. 2004	78.6 µg/m ³	4 th Qtr. 2006	13 times
Bakersfield - California	3 rd Qtr. 2004	63.1 µg/m ³	3 rd Qtr. 2004	24 times
Clovis - Villa	4 th Qtr. 2005	77.0 µg/m ³	4 th Qtr. 2005	9 times

A.3.3 Varying Sampling Schedules

Table A-5 shows the sampling schedules for San Joaquin Valley air monitoring sites. For non-seasonal monitoring sites, with a “year round” schedule, the sampling cycle does not change during the year. For seasonal monitoring sites, a 1 in 3 day sampling cycle is used from October through March and a 1 in 6 day sampling cycle from April through October. This seasonal schedule ensures that more samples are taken during the times of year when PM_{2.5} tends to be the highest.

Table A-5 Sampling schedules for SJV air monitoring sites, 2004-2006

Air Monitoring Site	Sampling Cycle	Schedule
Bakersfield- Planz	1 in 3 day	year round
Bakersfield - California	Daily	year round
Fresno - 1 st	Daily	year round
Modesto - 14 th	1 in 3 day	year round
Stockton - Hazelton	1 in 3 day	year round
Visalia - Church	1 in 3 day	year round
Merced - M st	1 in 3, 1 in 6 day	seasonal
Fresno - Winery	1 in 3, 1 in 6 day	seasonal
Corcoran - Patterson	1 in 3, 1 in 6 day	seasonal
Bakersfield - Golden	1 in 3, 1 in 6 day	seasonal
Clovis - Villa	1 in 3, 1 in 6 day	seasonal

The 98th percentile is defined as the daily value out of a year of monitoring data below which 98 percent of all values in the group fall. The procedure for calculating the 3-year average 98th percentile value when the site has complete data is as follows: first, sort all data values collected in each year from lowest to highest. Then assign a rank to each data value. Assign rank 1 to the lowest 24-hour average in each year, rank 2 to the second lowest, and so forth. Next, multiply the number of samples taken in the year by 0.98. Take the integer part of the product and add 1. This gives the rank corresponding to the 98th percentile. Find the value that corresponds to the rank. Calculate the 3-year average of all three values for the 98th percentile. Round decimals 0.5 or greater up and those less than 0.5 down. Compare the result to the standard of 65 µg/m³.

The sample calculation for the 3-year average 98th percentile value for Bakersfield - Planz is as follows: First, apply the data completeness test on 2004, 2005, and 2006 Bakersfield - Planz values. As mentioned in the previous paragraph, Bakersfield - Planz had incomplete data for 2006 2nd Quarter and 2004 4th Quarter. 2005 Bakersfield - Planz data was complete. The maximum value over three years for the same quarter was 78.6 µg/m³, which occurred in 4th Quarter of 2006 (substituted 13 times). The maximum value over three years for the 2nd Quarter at Bakersfield - Planz was 30.6 µg/m³, which occurred in 2005 (substituted 16 times). After data substitution, sort all data values collected in a year from lowest to highest.

Assign a rank for each data value. Rank 101, 100, 99 data points in 2006 were 78.6, 64.7, 50.6 $\mu\text{g}/\text{m}^3$, respectively. Next, calculate the rank of the 98th percentile for the year. Multiply, the number of samples taken in 2006 (101 samples) by 0.98, which equals 98.98. Then, take the integer part of the product and add 1. This gives the ranking that corresponds to the 98th percentile, which would be 99. Rank 99 corresponds to 50.6 $\mu\text{g}/\text{m}^3$ value, which is the 2006 98th percentile value. In order to find the 3-year average 98th percentile value, take the 98th percentile values by year as shown in Table 1, 78.6 (2004), 66.4 (2005), and 50.6 (2006) add them and divide by 3. Round the answer to the nearest integer, which would be 65 $\mu\text{g}/\text{m}^3$. Since this value is less than or equal to the PM2.5 NAAQS, Bakersfield - Planz is in attainment of the 24 hour PM2.5 NAAQS.

Calculating the 3-Year Average 98th Percentile for PM2.5 for seasonal sampling frequencies

Five sites (Fresno - Winery, Clovis - Villa, Bakersfield - Golden, Corcoran - Patterson, and Merced - M Street) have seasonal sampling frequencies that change during the year, as shown in Table A-5. Special calculations were performed for these sites to take the seasonal sampling frequencies into account.

The seasonal sampling calculation uses the following formula, where the smallest measured concentration, x , makes $W(x) > .98$:

$$W(x) = d_{high} \frac{d_{high}}{d_{high} + d_{low}} F_{High}(x) + \frac{d_{low}}{d_{high} + d_{low}} F_{Low}(x),$$

d_{high} = number of calendar days in the "High" season,
 d_{low} = number of calendar days in the "Low" season, ($d_{high} + d_{low}$ = days in a year)

$$F_a(x) = \frac{\text{number of samples in season } a \text{ that are } \leq x}{\text{number of samples in season } a}$$

such that $F_a(x)$ can be either High or Low,
 x is the measured concentration, and
 $d_{high} / (d_{high} + d_{low})$ and $d_{low} / (d_{high} + d_{low})$ are constant and are called seasonal "weights"

Example: Bakersfield – Golden 98th percentile value, 2006

The following example shows the procedures in determining the 2006 98th percentile value at Bakersfield - Golden, using the seasonal sampling calculation. The sampling cycle at Bakersfield - Golden is once every third day during the high months (October, November, December, January, February, and March) and once every six days during the low months (April, May, June, July, August, and September). Table A-6 is a

simplified version of the above equation in spreadsheet form. The high season ranking is shown with associated concentration values.

High season seasonal weight (SW) is calculated by taking the number of calendar days in the high season divided by the total number of calendar days in the year (182 days / 365 days) = 0.499.

FHigh is number of samples in season that are higher than the sample shown. For example, for the 61st rank concentration of 76.4 µg/m³, FHigh is calculated by 61 samples (number of samples in the high season that are less than then the smallest measured concentration) / 61 samples (number of samples in the season), which is equal to 1.

Low season SW is calculated by taking the number of calendar days in the low season divided by the total number of calendar days in the year (183 days / 365 days) = 0.501.

Since all of the high concentrations at Bakersfield-Golden for the calculated year occurred in the high season, FLow is 1. After using the following equation to calculate W(x):

$$W(x) = d_{high} \frac{d_{high}}{d_{high} + d_{low}} F_{High}(x) + \frac{d_{low}}{d_{high} + d_{low}} F_{Low}(x),$$

where W(x) = 1

The calculation is performed for the 57, 58, 59, and 60th ranked concentrations. The smallest value of x where W(x) is greater than 0.98 by moving up the right hand column until the first number greater than but not equal to 0.98 (0.983651) is identified. This value, which is the 98th percentile value, corresponds to the concentration of 64.4 µg/m³ for Bakersfield-Golden in 2006.

Table A-6 Calculating Weighted Percentiles for Two Seasons, 2006, Bakersfield Golden

High Season Seasonal Weight (SW) 0.498630137
 Low Season Seasonal Weight (SW) 0.5013699

Rank	Concentration (µg/m ³)	FHigh	FLow	W(x)
61	76.4	1	1	1
60	75.2	0.98360656	1	0.991826
59	64.4	0.96721311	1	0.983651
58	60.9	0.95081967	1	0.975477
57	58.7	0.93442623	1	

First W(x) > 0.98, starting from the lowest ranked, is the 98th percentile

Calculating the PM_{2.5} Annual Mean Value

The annual mean value is calculated by determining the four quarterly means for a site. First, add all the 24-hour average PM_{2.5} sample concentrations for each calendar quarter of a particular year; then divide by the number of samples. Then calculate the annual mean from the four quarterly means. Calculate the annual means for each of the other two years using the same approach above. Then calculate the 3-year average of the annual means. Round the number to the nearest tenth and compare to the NAAQS of 15.0 µg/m³.

The calculation for the PM_{2.5} annual mean value for Bakersfield - Planz in 2006 is as follows: First, apply the data completeness test on the 2006 Bakersfield - Planz measurements. As mentioned in the previous section on calculating the daily 98th percentile value, Bakersfield - Planz had incomplete data for 2006 2nd Quarter. Appendix N states that years with high values that don't meet the completeness test must still be used when the site has at least 11 samples in each quarter (minimum requirement is 11 samples per quarter for all sampling schedules). For Bakersfield - Planz the 2nd Quarter in 2006 had 18 samples. Next, average the samples for each quarter in 2006 and round the value to the nearest tenth, 19.3 µg/m³. These values also appear in Table A-7. Follow the same procedure above for calculating the 2004 (17.4 µg/m³) and 2005 (19.9 µg/m³) annual mean values. Then average the 2004 through 2006 annual mean values and round the value to the nearest tenth, 18.9 µg/m³. Then compare 18.9 µg/m³ to the PM_{2.5} annual mean NAAQS of 15.0 µg/m³. 18.9 µg/m³ is higher than the PM_{2.5} annual mean NAAQS and is non-attainment. Even though the 2nd Quarter 2006 had incomplete data at this site, the annual mean is still considered valid. No data substitution occurred to fill in for missing data to perform the annual mean PM_{2.5} calculation.

Table A-7 Quarterly Averages, 2006 Bakersfield - Planz PM_{2.5} Values

Quarter	Average concentrations (µg/m ³)
1 st Quarter	18.17931
2 nd Quarter	12.12778
3 rd Quarter	19.5
4 th Quarter	27.588
Annual Average	19.3

A.3.4 Data Validity Flags

Some of the measured values in the dataset were marked with a data validity flag. A data validity flag is used to mark data for specific reasons. The following procedures were considered when handling the data validity flags while performing the PM_{2.5} calculations:

1. All data points (values with no codes, capital and lower case validity flags) were used in determining completeness.
2. Data associated with capital letter validity codes were not used in actual attainment calculations.
3. Lower case and numeric "1" validity codes were used to determine completeness and calculate attainment values.
4. The data with the numeric validity "5" code, meaning "outlier, cause unknown" was not used in the actual calculations but only to be counted toward completeness.

The District downloaded the official PM_{2.5} 24-hour averages from EPA on March 21, 2007. On May 7, 2007, the District was informed by ARB that some invalid data collected from October 16, 2005 through November 6, 2005 (8 samples) from the Clovis air-monitoring site remained in the official EPA database. The District took action to remove this data, and the data is no longer in the database. These data were excluded in attainment calculations. Overall, there were 349 samples collected Valley-wide that had a data validity flag applied to the sample. The complete set of data including data with data validity flags for 2004-2006 is shown in Table A-13 at the end of this appendix.

A.4 DATA ANALYSIS, 1999-2006

As required by EPA, the PM_{2.5} monitoring was underway nation-wide beginning in 1999. Table A-8 summarizes the PM_{2.5} 98th percentile value for currently operating PM_{2.5} monitoring sites in the San Joaquin Valley Air Basin (SJVAB) for the years 1999-2006. The calculation of the PM_{2.5} 24-hour 98th percentile concentration is explained in Section A.3 of this Appendix. Table A-9 shows the 24-hour PM_{2.5} 3-year average of the 98th percentile value for each site within the SJVAB for the years 1999-2006. A dash (-) indicates that there is insufficient (or no) data available to determine the value. Table A-10 summarizes the PM_{2.5} annual values for currently operating sites in the SJVAB for the years 1999-2006. The calculation of the annual PM_{2.5} concentration is also explained in Section A.3 of this Appendix. Table A-11 shows the PM_{2.5} 3-year average annual mean values for each site within the SJVAB for the years 1999-2006.

Current attainment status is determined for each site by analyzing PM_{2.5} measurements² from 2004 through 2006. If any monitoring site within the SJVAB has

² 40 CFR (Code of Federal Regulations) Part 50, Appendix N require that attainment calculations be based on at least the most recent three complete years of quality reviewed data.

both a 3-year average 98th percentile 24-hour PM_{2.5} design value that is greater than 65 µg/m³ and a 3-year annual mean PM_{2.5} design value that is greater than 15.0 µg/m³, then the entire air basin is designated nonattainment³. Table A-12 summarizes the current attainment status on a site-by-site basis. Bold values indicate values over the National Ambient Air Quality Standard (NAAQS). Table A-12 shows that three of the 11 air monitoring sites (Stockton, Modesto, and Merced) in the SJVAB currently meet the attainment test for PM_{2.5}. Eight out of 11 sites are nonattainment for the PM_{2.5} standard for the 2004-2006 time period, and three of the sites attain the PM_{2.5} NAAQS. This is an improvement from the 1999-2001 period, when all sites were nonattainment⁴.

Figures A-1 through A-11 show the 3-year average 98th percentile 24-hour average PM_{2.5} concentrations for each San Joaquin Valley air monitoring site. Figures A-12 through A-22 show the 3-year annual mean design values for 1999-2006. The years stated on the x-axis in Figures A-1 through A-22 represent the end year of the 3-year averaging period. Figure A-23 and Figure A-24 illustrates the San Joaquin Valley air basin map as a bubble chart with 3-year average 98th percentile 24 hour average from the year 2002 and 2006, respectively. Figure A-25 and Figure A-26 shows the San Joaquin Valley air basin map as a bubble chart with 3-year annual mean PM_{2.5} design values depicted on a site-by-site basis from the year 2002 and 2006, respectively. Figures A-23 and A-24 depict an improvement of the PM_{2.5} air quality from 2002 to 2006. More air quality trend data can be found at <<http://www.arb.ca.gov>>.

A.5 TREND AND SPATIAL VARIATIONS

A.5.1 Local Trends

While the peak San Joaquin Valley design value site trend (Bakersfield - Planz) remains essentially unchanged, a majority of the sites are improving. Ten of the 11 air monitoring sites in the SJVAB are showing an improving air quality trend: Stockton, Modesto, Merced, Fresno-1st, Fresno-Winery, Clovis, Corcoran, Visalia, Bakersfield-California, and Bakersfield-Golden. Tables A-8 through A-11 show PM_{2.5} averages from 1999-2006. Table A-12 shows the attainment status for each SJV site based on 2004-2006 data. Figures A-2 through A-22 show improving trends. The degree of the improvement of the trend varies from essentially unchanged at Bakersfield-Planz (Figure A-3) to downward at Visalia -Church (Figure A-15).

³ Under the 1997 PM_{2.5} standard, the standard upon which this plan is based.

⁴ Please note that Fresno-1st had incomplete data for 2001 for the annual mean calculation. However, based on the years before and after, the annual mean value would have been above the NAAQS in 2001.

Table A-8 24-hour PM_{2.5} 98th percentile values (µg/m³), 1999-2006

Site	1999	2000	2001	2002	2003	2004	2005	2006
Stockton	79.0	55.0	58.0	50.0	41.0	36.0	44.0	42.0
Modesto	95.0	71.0	64.0	64.0	47.0	45.0	55.0	52.0
Merced	**	80.3	**	55.1	44.2	43.0	48.3	43.8

* Monitor not in operation.

** Does not meet the requirement for the 50% of the observations in each quarter. Can't calculate the 98th percentile through substitution.

Derived value via data substitution.

Valid data, but does not meet the 75% data completeness test.

98th percentile value changed due to flagged data.

Table A-9 3-year average of the 24-hour PM_{2.5} 98th percentile values (µg / m³)

Site	1999-2001	2000-2002	2001-2003	2002-2004	2003-2005	2004-2006
Stockton	64	54	50	42	40	41

Bakersfield-Golden	22.6	21.9	21.2	20.6	18.9	18.5
Bakersfield-California	22.1	22.4	20.7	19.8	17.9	18.5
Bakersfield-Planz	-	22.6	21.8	19.6	18.4	18.9

Annual average considered valid (each quarter has more than 11 samples), but does not meet the 75% completeness requirement.

- A dash indicates that there is insufficient data available to determine the value.

⁵ A total of 11 PM_{2.5} monitoring sites are currently operated in the SJVAB.

Table A-12 Current (2004 – 2006) PM_{2.5} air quality design values and attainment status for the San Joaquin Valley Air Basin

Monitoring Station	Attainment Tests		Attainment Status**
	Three -Year Average 98 th Percentile 24 hr. ($\mu\text{g} / \text{m}^3$)*	Three - Year Annual Average ($\mu\text{g} / \text{m}^3$)	
Stockton	41	12.9	Yes
Modesto	51	14.1	Yes
Merced	45	14.7	Yes
Fresno-1st	58	16.7	No
Fresno-Winery	59	17.2	No
Clovis	57	16.2	No
Corcoran	58	17.2	No
Visalia	56	18.2	No
Bakersfield-Golden	64	18.5	No
Bakersfield-California	62	18.5	No
Bakersfield-Planz	65	18.9	No

* First, average the 4 quarterly values for each of three years, then next average those three values to obtain the three-year average.

** A station is considered in attainment if the three- year average 98th percentile 24-hour PM_{2.5} concentration is less than or equal to 65 $\mu\text{g} / \text{m}^3$ and the three year average annual PM_{2.5} concentration is less than or equal to 15.0 $\mu\text{g} / \text{m}^3$.

Bold is considered nonattainment.
