Dear Mr. Scott:

Enclosed for your review and comment is the District's analysis of RME, Inc. - Woodbridge Winery's application for an Authority to Construct for a specific limiting condition (SLC) for wine production operations, 141 new wine fermentation and storage tanks, and modification of 13 existing wine storage tanks, at 5950 E. Woodbridge Road in Acampo, CA.

After addressing all comments made during the 30-day public notice and the 45-day EPA comment periods, the Authorities to Construct will be issued to the facility with a Certificate of Conformity. Prior to operating with modifications authorized by the Authorities to Construct, the facility must submit an application to modify the Title V permit as an administrative amendment, in accordance with District Rule 2520, Section 11.5.

The public notice will be published approximately three days from the date of this letter. Please submit your written comments on this project within the 30-day public comment period which begins on the date of publication of the public notice.

Thank you for your cooperation in this matter. If you have any questions regarding this matter, please contact Mr. Jonah Aiyabei of Permit Services at (559) 230-5910.

Sincerely,

David Warner
Director of Permit Services

Enclosures
Dear Mr. Tollstrup:

Enclosed for your review and comment is the District's analysis of RME, Inc. - Woodbridge Winery's application for an Authority to Construct for a specific limiting condition (SLC) for wine production operations, 141 new wine fermentation and storage tanks, and modification of 13 existing wine storage tanks, at 5950 E. Woodbridge Road in Acampo, CA. The applicant is requesting that a Certificate of Conformity with the procedural requirements of 40 CFR Part 70 be issued with this project.

Enclosed is the engineering evaluation of this application with a copy of the current Title V permit and proposed Authorities to Construct with Certificate of Conformity. After demonstrating compliance with the Authorities to Construct, the conditions will be incorporated into the facility's Title V permit through an administrative amendment.

The notice of preliminary decision for this project will be published approximately three days from the date of this letter. Please submit your written comments on this project within the 30-day public comment period which begins on the date of publication of the public notice.

Thank you for your cooperation in this matter. If you have any questions regarding this matter, please contact Mr. Jonah Aiyabei of Permit Services at (559) 230-5910.

Sincerely,

David Warner
Director of Permit Services

Re: Proposed ATC / Certificate of Conformity (Significant Mod)
Project Number: N-1092377

Dear Mr. Rios:

Enclosed for your review and comment is the District's analysis of RME, Inc. - Woodbridge Winery's application for an Authority to Construct for a specific limiting condition (SLC) for wine production operations, 141 new wine fermentation and storage tanks, and modification of 13 existing wine storage tanks, at 5950 E. Woodbridge Road in Acampo, CA, which has been issued a Title V permit. RME, Inc. - Woodbridge Winery is requesting that a Certificate of Conformity, with the procedural requirements of 40 CFR Part 70, be issued with this project.

Enclosed is the engineering evaluation of this application with a copy of the current Title V permit and proposed Authorities to Construct with Certificate of Conformity. After demonstrating compliance with the Authorities to Construct, the conditions will be incorporated into the facility's Title V permit through an administrative amendment.

Please submit your written comments on this project within the 45-day public comment period that begins on the date you receive this letter.

Thank you for your cooperation in this matter. If you have any questions regarding this matter, please contact Mr. Jonah Aiyabei of Permit Services at (559) 230-5910.

Sincerely,

David Warner
Director of Permit Services

Enclosure
NOTICE OF PRELIMINARY DECISION
FOR THE PROPOSED ISSUANCE OF
AN AUTHORITY TO CONSTRUCT

NOTICE IS HEREBY GIVEN that the San Joaquin Valley Unified Air Pollution Control District solicits public comment on the proposed issuance of Authority to Construct to RME, Inc. - Woodbridge Winery for a specific limiting condition (SLC) for wine production operations, 141 new wine fermentation and storage tanks, and modification of 13 existing wine storage tanks, at 5950 E. Woodbridge Road in Acampo, CA.

The District's analysis of the legal and factual basis for this proposed action, Project #N-1092377, is available for public inspection at http://www.valleyair.org/notices/public_notices_idx.htm and the District office at the address below. This will be the public's only opportunity to comment on the specific conditions of the modification. If requested by the public, the District will hold a public hearing regarding issuance of this modification. For additional information, please contact Mr. Jim Swaney, Permit Services Manager, at (559) 230-5900. Written comments on this project must be submitted within 30 days of the publication date of this notice to DAVID WARNER, DIRECTOR OF PERMIT SERVICES, SAN JOAQUIN VALLEY UNIFIED AIR POLLUTION CONTROL DISTRICT, 1990 EAST GETTYSBURG AVENUE, FRESNO, CA 93726.
I. Proposal

The primary business of Woodbridge Winery is the production of table wines and related beverages. In order to increase operational flexibility, the Woodbridge Winery proposes to establish a Specific Limiting Condition (SLC) which limits annual wine fermentation and storage emissions from all wine tanks at their facility to the Pre-Project Potential to Emit of the pre-project fermentation and storage capacities of the facility. The facility has also proposed the following changes:

- Install 141 new stainless steel red and white wine fermentation and wine storage tanks with a total capacity of 2,146,759 gallons (units 652-0 through 792-0)
- Modify 8 existing storage-only tanks (permit units 629-1 through 636-1) as follows: (a) allow both fermentation (red and white wine) and storage; (b) for each tank, increase existing daily storage throughput limit from 62,554 gallons to four times the maximum nominal tank capacity stated in the equipment description; (c) remove existing annual storage throughput limit; and (d) increase ethanol content of wine stored in each tank from 16 to 20 percent by volume.
- Modify 5 existing storage-only tanks (permit units 644-1 through 648-1) as follows: (a) allow both fermentation (red and white wine) and storage; (b) for each tank, increase existing daily storage throughput limit to four times the maximum nominal tank capacity stated in the equipment description; (c) remove existing annual storage throughput limit; and (d) increase ethanol content of wine stored in each tank to 20 percent by volume.
- Administratively correct the equipment descriptions on some permit units currently permitted with in-house Permits to Operate as required to indicate correct tanks usage, control equipment and other existing tank parameters.
Winery tanks potentially operate as two separate emissions units; typically they are used for fermentation operations during the crush season and then are used for storage tank operations when not in use as a fermenter. This project is an NSR modification of all the fermentation emissions units in this winery. It is also an NSR modification of certain wine storage emissions units which were permitted under NSR subsequent to the initial permitting action of the wine tanks at this facility (issuance of inhouse PTO’s as a result of loss-of-exemption). Existing storage tank emissions units at this facility with Inhouse Permits to Operate are not undergoing a modification by this project as defined in District Rule 2201; however, since all tank permits at this facility will be revised as a result of a modification of the fermentation emission unit associated with each tank, current prohibitory conditions for compliance with District Rule 4694 will be added to the permits as applicable. Copies of existing Permits to Operate and Authorities to Construct are included as Appendix A.

II. Applicable Rules

Rule 2201  New and Modified Stationary Source Review Rule (9/21/06)
Rule 2520  Federally Mandated Operating Permits (6/21/01)
Rule 4001  New Source Performance Standards (4/14/99)
Rule 4002  National Emissions Standards for Hazardous Air Pollutants (5/20/04)
Rule 4102  Nuisance (12/17/92)
Rule 4694  Wine Fermentation and Storage Tanks (12/15/05)
CH&SC 41700  Health Risk Assessment
CH&SC 42301.6  School Notice
Public Resources Code 21000-21177: California Environmental Quality Act (CEQA)
California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000-15387: CEQA Guidelines

III. Project Location

The facility is located at 5950 E. Woodbridge Rd. in Acampo, CA. The equipment is not located within 1,000 feet of the outer boundary of a K-12 school. Therefore, the public notification requirement of California Health and Safety Code 42301.6 is not applicable to this project.

IV. Process Description

Woodbridge Winery Co. produces both red and white table wines, as well as other specialty wine products, from the fermentation of grapes. During the "crush season", typically from late August to late November, both red and white grapes are received by truck and delivered to a crusher-stemmer which serves to crush the grapes and remove the stems. In the case of red wines, the resultant juice (termed "must" and containing the grape skins, pulp and seeds) is pumped to red wine fermentation tanks for fermentation, a batch process. The red wine fermentation tanks are specifically designed to ferment the must in contact with the skins and to allow the separation of the skins and seeds from the wine after fermentation. In the case of white
wines, the must is sent to screens and presses for separation of grape skins and seeds prior to fermentation. After separation of the skins and seeds, the white must is transferred to a fermentation tank. White wine fermentation can be carried out in a tank without design provisions for solids separation since the skins and seeds have already been separated.

After transfer of the must (for red or white wine) to the fermentation tank, the must is inoculated with yeast which initiates the fermentation reactions. During fermentation, the yeast metabolizes the sugar in the grape juice, converting it to ethanol and carbon dioxide while releasing heat. Temperature is typically controlled by refrigeration, and is maintained at 45 - 65 °F for white wine fermentation and 70 - 95 °F for red wine fermentation. The sugar content of the fermentation mass is measured in °Brix (weight %) and is typically 22 – 26° for unfermented grape juice, dropping to 4° or less at the end of fermentation. Finished ethanol concentration is approximately 10 to 14 percent by volume. Batch fermentation requires 3-5 days per batch for red wine and 1-2 weeks per batch for white wine. VOCs are emitted during the fermentation process along with the CO₂. The VOCs consist primarily of ethanol along with small quantities of other fermentation byproducts.

Following the completion of fermentation, white wine is transferred directly to storage tanks. Red wine is first directed to the presses for separation of solids and then routed to the storage tanks. All tanks in the winery typically operate as two separate emissions units: (1) a fermentation operation during which the tank is vented directly to the atmosphere to release the evolved CO₂ byproduct from the fermentation reaction; and (2) a storage operation during which the tank is closed to minimize contact with air and refrigerated to preserve the wine. Post-fermentation operations such as cold stabilization, racking, and filtration are conducted in the tanks, resulting in a number of inter-tank transfers during the period between the end of fermentation and bottling or bulk shipment. Storage operations are conducted year-round. VOC emissions occur primarily as a result of the inter-tank transfers which are necessitated by the post fermentation operations.

V. Equipment Listing

Pre-Project Equipment Description:

The facility currently has 617 tanks, under the categories summarized below, that will be affected by the proposed modifications.

- 26 Concrete red and white wine fermentation and storage tanks - 1,070,018 gallons total.
- 16 Open concrete red and white wine fermentation-only tanks - 624,000 gallons total.
- 40 Redwood red and white wine fermentation and storage tanks - 858,990 gallons total.
- 522 Stainless steel red and white wine fermentation and storage tanks - 49,938,564 gallons total.
- 13 Stainless steel red and white wine storage-only tanks - 554,987 gallons total.

Pre-project equipment descriptions are listed in Appendix B.
Proposed Modification:

- Establish SLC for wine production operations (fermentation and storage) emissions from all wine tanks at the facility.
- Install 141 new stainless steel red and white wine fermentation and wine storage tanks with a total capacity of 2,146,759 gallons (units 652-0 through 792-0).
- Modify 8 existing storage-only tanks (permit units 629-1 through 636-1) as follows: (a) allow both fermentation (red and white wine) and storage; (b) for each tank, increase existing daily storage throughput limit from 62,554 gallons to four times the maximum nominal tank capacity stated in the equipment description; (c) remove existing annual storage throughput limit; and (d) increase ethanol content of wine stored in each tank from 16 to 20 percent by volume.
- Modify 5 existing storage-only tanks (permit units 644-1 through 648-1) as follows: (a) allow both fermentation (red and white wine) and storage; (b) for each tank, increase existing daily storage throughput limit to four times the maximum nominal tank capacity stated in the equipment description; (c) remove existing annual storage throughput limit; and (d) increase ethanol content of wine stored in each tank to 20 percent by volume.
- Administratively correct the equipment descriptions on some permit units currently permitted with in-house Permits to Operate as required to indicate correct tanks usage, control equipment and other existing tank parameters.

Post Project Equipment Description:

After the proposed modifications, the facility will have a total of 734 tanks under the following categories:

- 26 Concrete red and white wine fermentation and storage tanks - 1,070,018 gallons total.
- 16 Open concrete red and white wine fermentation-only tanks - 624,000 gallons total.
- 40 Redwood red and white wine fermentation and storage tanks - 858,990 gallons total.
- 676 Stainless steel red and white wine fermentation and storage tanks - 52,640,310 gallons total.

Post-project equipment descriptions are listed in Appendix C.

VI. Emission Control Technology Evaluation

VOCs (ethanol) are emitted from wine storage tanks as a result of both working losses (which occur when the liquid level in the tank changes) and breathing losses (expansion and contraction effects due to temperature variations). The proposed pressure/vacuum valve limits these emissions by requiring the maximum amount of variation in tank pressure before allowing the tank to vent to the atmosphere or allowing air admission to the tank. When wine
storage tanks are insulated or located in a climate controlled building, breathing losses are considered to be negligible.

No emission controls are currently required on wine fermentation tanks since no technology has been achieved in practice and all identified technologically feasible controls have been determined to not be cost effective.

VII. General Calculations

A. Assumptions

- Each tank generally consists of two emissions units: (1) a fermentation emissions unit, and (2) a storage emissions unit.

- All existing tanks may be used for fermentation of red or white wine, except those designated as storage-only tanks by NSR permit conditions. All tanks may be used for storage of red or white wine, except open-top tanks and those designated as fermentation-only tanks by NSR permit conditions.

- Daily Potential to Emit for both storage and fermentation operations will be calculated on a tank-by-tank basis as outlined in District FYI-114, Estimating VOC Emissions from Wine Storage Tanks.

- For enclosed tanks with refrigeration and/or insulation (or equivalent) and P/V valves, daily breathing losses from storage of wine are assumed to be negligible.

- Pre-project maximum ethanol content of stored wine is 20%, unless stated otherwise on the existing permit.

- Pre-project, all existing tanks at this facility can potentially be used as red or white wine fermentation tanks with the exception of permit units 629-0 through 636-1 and 644-1 through 648-1, which were permitted for storage operations only through NSR permitting actions subsequent to the initial in-house PTO issue. The total tank volume that can potentially be used for wine fermentation is 52,491,572, calculated as total facility tank volume (53,046,559 gallons) minus total volume of storage-only tanks (554,987 gallons).

- Grape crushing capacity at this facility is 13,200 tons per day based on information provided by the applicant.

- Pressing capacity at this facility is 8,400 tons per day based on information provided by the applicant.
• Annual Pre-Project Potential to Emit for fermentation operations will be calculated as a combined value reflecting potential emissions from the winery's total wine production capacity.

• The calculation approach for determining combined emission values for the fermentation operations will follow the draft District policy attached in Appendix D.

B. Emission Factors

The required emission factors for fermentation and storage operations are taken from District FYI-114, Estimating VOC Emissions from Winery Tanks:

Red Wine Fermentation:
  Daily: 3.46 lb-VOC/1000 gallons tank capacity
  Annual: 6.2 lb-VOC/1000 gallons annual throughput

White Wine Fermentation
  Daily: 1.62 lb-VOC/1000 gallons tank capacity
  Annual: 2.5 lb-VOC/1000 gallons annual throughput

Wine Storage Working Losses @ 14% Ethanol
  Daily: 0.289 lb-VOC/1000 gallons daily throughput
  Annual: 0.198 lb-VOC/1000 gallons annual throughput

Wine Storage Working Losses @ 16% Ethanol
  Daily: 0.335 lb-VOC/1000 gallons daily throughput
  Annual: 0.230 lb-VOC/1000 gallons annual throughput

Wine Storage Working Losses @ 20% Ethanol
  Daily: 0.432 lb-VOC/1000 gallons daily throughput
  Annual: 0.297 lb-VOC/1000 gallons annual throughput

C. Calculations

1. Pre-Project Potential to Emit (PE1)

New Wine Tank Permit Units N-2321-652-0 through N-2321-792-0

Since these are new emissions units (fermentation and Storage), PE1 = 0 (all pollutants) for both storage and fermentation operations in these tanks.

Existing Wine Tanks

a. Daily PE1 for each wine fermentation tank emission unit in this project:

  The daily PE1 for each fermentation tank emission unit is listed in Appendix E.
b. Daily PE1 for each storage tank emission unit in this project:

The daily PE1 for each storage tank emission unit is listed in Appendix F.

c. Annual PE1 for fermentation operations:

The combined Pre-Project Potential to Emit (all existing fermentation tanks) for this facility's wine fermentation operation is determined in the following sequence of calculations (see draft District policy "Calculation of the Potential to Emit for VOC Emissions from Wine Fermentation and Storage Operations" in Appendix D):

1. Potential fermentation emissions from a 100% white wine production scenario are first determined:

   White wine production capacity is determined as the lesser of the production capacities of either the crushing or pressing equipment or wine fermentation tanks at the facility:
   
   \[ W_W = \text{White wine production capacity (gallons per year as measured immediately after pressing)} \]
   
   \[ W1 = C \times D_w \times M \] (limited by crusher capacity)
   
   \[ W2 = P \times D_w \times M \] (limited by pressing capacity)
   
   \[ W3 = \frac{V_{FW} \times D_w}{W_{FW}} \] (limited by white fermenter volume)
   
   \[ W4 = \frac{V_r \times D_w}{R_{TW}} \] (limited by overall tank processing)

   where,
   
   \[ C = \text{grape crushing capacity} = 13,200 \text{ tons/day} \]
   
   \[ D_w = \text{days in a white wine crush season} = 120 \text{ days} \]
   
   \[ M = \text{amount of grape juice produced per ton of grapes crushed} = 200 \text{ gallons} \]
   
   \[ P = \text{pressing capacity} = 8,400 \text{ tons per day} \]
   
   \[ W_{FW} = \text{White fermentation period} = 10 \text{ days} \]
   
   \[ R_{TW} = \text{Total winery retention time for white wine, 40 + 10 = 50 days} \]
   
   \[ V_{FW} = \text{total volume of white wine fermenters} = 52,491,572 \text{ gallons} \]
   
   \[ V_r = \text{Total Winery Cooperage} = 52,650,384 \text{ gallons} \]

   Potential white wine fermentation emissions are then determined by applying the white fermentation emission factor stated in FYI-114:

   \[ PE_{\text{white fermentation}} = E_{fw} \times W_W \]
   
   \[ E_{fw} = \text{white wine emission factor} = 2.5 \text{ lb-VOC/1000 gal} \]

   Performing the above calculations yields
   
   \[ W1 = 316.80 \text{ MG/year (million gals/year)} \]
   
   \[ W2 = 201.60 \text{ MG/year} \]
   
   \[ W3 = 629.90 \text{ MG/year} \]
W4 = 126.36 MG/year

Selecting $W_W = W4 = 126.36$ MG/year and applying the emission factor for white wine fermentation yields:

$$PE_{\text{whitefermentation}} = 315,900 \text{ lb-VOC/year}$$

2. Potential fermentation emissions from a 100% red wine production scenario are then calculated:

Red wine production capacity is determined as the lesser of the production capacities of either the crushing, pressing or tankage.

$W_R = $ Red wine production capacity (gallons per year as measured immediately after pressing) and is the lesser of the following four calculations:

$W1 = C \times D_r \times M$ (limited by crusher capacity)

$W2 = P \times D_r \times M$ (limited by pressing capacity)

$W3 = \left( V_{FR} \times F \times D_i \right) / R_{FR}$ (limited by red fermenter volume)

$W4 = \left( V_T \times D_i \right) / R_{TS}$ (limited by overall tank processing)

$C =$ grape crushing capacity $= 13,200$ tons/day

$D_r =$ days in a red wine crush season $= 120$ days

$F =$ Fill factor for red wine fermentation $= 80\%$

$M =$ amount of grape juice produced per ton of grapes crushed $= 200$ gallons

$P =$ pressing capacity $= 8,400$ tons per day

$R_{FR} =$ Red fermentation period $= 5$ days

$R_{TS} =$ Total winery retention time for red wine, $40 + 5 = 45$ days

$V_{FR} =$ total volume of red wine fermenters $= 52,491,572$ gallons

$V_T =$ Total Winery Cooperage $= 52,640,105$ gallons

Potential red wine fermentation emissions are then determined by applying the red fermentation emission factor stated above.

$$PE_{\text{redfermentation}} = E_{fr} \times \frac{W}{1,000}$$

$E_{fr} =$ red wine emission factor $= 6.2$ lb-VOC/1000 gal (District Rule 4694)

Performing the above calculations yields

$W1 = 316.80$ MG/year (million gals/year)

$W2 = 201.60$ MG/year

$W3 = 1,007.84$ MG/year

$W4 = 140.37$ MG/year

Selecting $W_R = W4 = 140.37$ MG/year and applying the emission factor for red wine fermentation yields:

$$PE_{\text{redfermentation}} = 870,294 \text{ lb-VOC/year}$$
3. The facility's PE for fermentation operations is then taken to be the greater of either the white or red PE's determined above.

\[
\text{PE}_{\text{fermentation}} = \text{greater of } \text{PE}_{\text{whitefermentation}} \text{ and } \text{PE}_{\text{redfermentation}}
\]

\[
\text{PE}_{\text{fermentation}} = \text{PE}_{\text{redfermentation}}
\]

\[
\text{PE}_{\text{fermentation}} = 870,294 \text{ lb-VOC/year}
\]

d. Annual PE1 for storage operations:

The storage emissions will be calculated using the procedure described in the District's FYI 114. Breathing loss emissions are considered negligible for all storage tanks, since none of the tanks are subject to any significant diurnal temperature variations. The majority of the tanks (accounting for 96.3% of the total storage volume) are enclosed stainless steel tanks with pressure/vacuum relief valves and either insulation, refrigeration or both. Per FYI 114, breathing losses from insulated and/or refrigerated tanks may be ignored since the diurnal temperature swings that are primarily responsible for breathing emissions are significantly eradicated by insulation and/or refrigeration. A few of the tanks (accounting for only 3.7% of the total storage volume) are constructed of either concrete or wood. These tanks are enclosed, equipped with pressure/vacuum relief valves and located indoors. Considering that concrete and wood are by themselves insulative materials (i.e. poor conductors of heat, compared to steel), and that the tanks are located indoors, it can be concluded that these tanks are not subject to any significant diurnal temperature ranges, and therefore have negligible breathing loss emissions. Storage emissions will therefore consist only of working loss emissions.

Since the emission factors for wine storage are the same for both white and red wine, emissions from storage tank operations are determined based on the throughput of the maximum quantity of wine the facility is able to produce. In the preceding sections, it was determined that the facility's wine production limiting factor for both red and white wines is the total cooperage (combined fermentation and storage/processing capacity). Based on cooperage, the facility's annual red wine production capacity is higher than the white wine production capacity; hence storage emissions will be based on the red wine production capacity. Based on cooperage limitations, red wine production capacity is 140.37 million gallons of per year.

Storage emissions are calculated as follows:

\[
\text{PE}_{\text{storage}} = E_s \times T \times W_R
\]

Where:

\[
E_s = \text{wine storage emission factor based on District FYI-114 = 0.297 lb-VOC/1000 gallons of wine transferred for 20% alcohol wine; 0.230 lb-VOC/1000 gallons of wine transferred for 16% alcohol wine; and 0.198 lb-VOC/1000 gallons of wine transferred for 14% alcohol wine;}
\]
$T = \text{Total post fermentation inter-tank transfers per batch of wine} = 8$

$W_R = \text{maximum quantity of wine the facility can produce} = 140.37 \text{ million gallons of red wine per year}$

Since the calculated wine production rates have already considered the limitation introduced by the NSR limit on the storage-only tanks, no further consideration of throughput capacity is required for calculation the PE for storage operations. However, some of the storage-only tanks have an ethanol limit less than 20%, which requires a different emission factor. Units 629-1 through 636-1 are limited to 16% ethanol and have a combined annual throughput limit of 2,001,728 gallons. Units 644-1 through 648-1 are limited to 14% ethanol and have a combined maximum throughput of 14,850,000 gallons.

\[
PE_{\text{storage}} = E_s \times T \times W_R
\]

\[
= (0.297/1000) \times 8 \times (140.37 - 2.00 - 14.85) \times 10^6
+ (0.230/1000) \times 2.00 \times 10^6
+ (0.198/1000) \times 14.85 \times 10^6
\]

\[
= (293,484 + 460 + 2,940) \text{ lb-VOC/year}
\]

\[
= 296,884 \text{ lb-VOC/year}
\]

2. Post Project Potential to Emit (PE2)

a. Daily PE2 for each fermentation tank emission unit:

For the pre-existing fermentation tank emission units, except the storage-only tanks that are being modified to allow fermentation, daily PE2 = daily PE1.

For new fermentation tank emission units, and tanks modified from storage-only to storage and fermentation use, daily PE2 is listed in Appendix G.

b. Daily PE2 for each storage tank emission unit:

For each existing storage tank emission unit, daily PE2 = daily PE1.

For new and modified storage tank emission units PE2 is listed in Appendix H.

c. Annual PE2 for fermentation operations:

This project establishes a Specific Limiting Condition (SLC) to limit the combined post project annual fermentation emissions from 1) existing fermentation tanks, 2) existing storage tanks to be designated as fermenters as a result of this project and 3) new fermentation tanks added by this project, to the Pre-Project Potential to Emit of the existing fermentation operations.
Therefore,

\[
PE_{2\text{fermentation}} \quad (\text{existing + modified + new tanks}) = PE_{1\text{fermentation}} \quad (\text{existing tanks}) = 870,294 \text{ lb-VOC/yr}
\]

d. Annual PE2 for each wine storage tank emission unit in this project:

This project establishes a Specific Limiting Condition (SLC) to limit the combined post project annual storage emissions from existing storage tanks and new storage tanks added through this project to the Pre-Project Potential to Emit of the existing storage operations.

Therefore,

\[
PE_{2\text{storage}} \quad (\text{existing + new tanks}) = PE_{1\text{storage}} \quad (\text{existing tanks}) = 296,884 \text{ lb-VOC/yr}
\]

3. Pre-Project Stationary Source Potential to Emit (SSPE1)

Pursuant to Section 4.9 of District Rule 2201, the Pre-Project Stationary Source Potential to Emit (SSPE1) is the Potential to Emit (PE) from all units with valid Authorities to Construct (ATC) or Permits to Operate (PTO) at the Stationary Source and the quantity of emission reduction credits (ERC) which have been banked since September 19, 1991 for Actual Emissions Reductions that have occurred at the source, and which have not been used on-site.

This project only concerns VOC emissions. This facility acknowledges that its VOC emissions are already above the Offset and Major Source Thresholds for VOC emissions; therefore, SSPE1 calculations are not necessary.

4. Post Project Stationary Source Potential to Emit (SSPE2)

Pursuant to Section 4.10 of District Rule 2201, the Post Project Stationary Source Potential to Emit (SSPE2) is the Potential to Emit (PE) from all units with valid Authorities to Construct (ATC) or Permits to Operate (PTO) at the Stationary Source and the quantity of emission reduction credits (ERC) which have been banked since September 19, 1991 for Actual Emissions Reductions that have occurred at the source, and which have not been used on-site.

This project only concerns VOC emissions. This facility acknowledges that its VOC emissions are already above the Offset and Major Source Thresholds for VOC emissions; therefore, SSPE2 calculations are not necessary.
5. Major Source Determination

This source is an existing Major Source for VOC emissions and will remain a Major Source for VOC. No change in other pollutants are proposed or expected as a result of this project.

6. Baseline Emissions (BE)

The BE calculation (in lbs/year) is performed pollutant-by-pollutant for each unit within the project, to calculate the QNEC and if applicable, to determine the amount of offsets required.

Pursuant to Section 3.7 of District Rule 2201, BE = Pre-project Potential to Emit for:
• Any unit located at a non-Major Source,
• Any Highly-Utilized Emissions Unit, located at a Major Source,
• Any Fully-Offset Emissions Unit, located at a Major Source, or
• Any Clean Emissions Unit, located at a Major Source.

otherwise,

BE = Historic Actual Emissions (HAE), calculated pursuant to Section 3.22 of District Rule 2201.

The permit units in this project only emit VOC and therefore the BE determination is only required for this pollutant, as discussed in the following sections:

BE VOC

Units Located at a Non-Major Source

As shown in Section VII.C.5 above, the facility is a major source for VOC emissions.

Highly-Utilized Emissions Units, located at a Major Source

Due to the nature of winery operations, excess tank capacity is installed at wineries such that the actual usage is always significantly less than the potential operation. Therefore, none of the tanks in this project are Highly-Utilized Emissions Units.

Fully Offset Emissions Units, located at a Major Source

Offsets were previously provided for the storage tank emissions units for permit units N-2321-629 through 636. Therefore these are Fully Offset Emissions Units. No other units affected by this project are Fully Offset Emissions Units.
Clean Emissions Unit, Located at a Major Source

Pursuant to Rule 2201, Section 3.12, a Clean Emissions Unit is defined as an emissions unit that is "equipped with an emissions control technology with a minimum control efficiency of at least 95% or is equipped with emission control technology that meets the requirements for achieved-in-practice BACT as accepted by the APCO during the five years immediately prior to the submission of the complete application.

All fermentation tanks in this project meet the District's current achieved-in-practice BACT for fermentation tanks (see Appendix I). Therefore all fermentation tank emissions units are Clean Emissions Units pursuant to District Rule 2201 and, for the combined fermentation emissions of all tanks in this project,

\[ \Sigma BE_{\text{fermentation}} = \Sigma PE1_{\text{fermentation}} = 870,294 \text{ lb-VOC/year} \]

All stainless tanks in this project meet the District's current achieved-in-practice BACT for storage tanks (see Appendix J). All wood and concrete tanks meet the District's new achieved-in-practice BACT for storage tanks (see Appendix K). Therefore all storage tank emissions units are Clean Emissions Units pursuant to District Rule 2201 and, for the combined storage emissions of all tanks in this project,

\[ \Sigma BE_{\text{storage}} = \Sigma PE1_{\text{storage}} = 296,884 \text{ lb-VOC/year} \]

7. Major Modification

Major Modification is defined in 40 CFR Part 51.165 as "any physical change in or change in the method of operation of a major stationary source that would result in a significant net emissions increase of any pollutant subject to regulation under the Act."

The net emissions increase is calculated as the increase in actual emissions resulting from the project. The post project actual emissions are conservatively assumed to be equal to the Post Project Potential to Emit. The calculated net emissions increase is significant if it exceeds the values in the following table:

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Threshold (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>VOC</td>
<td>50,000</td>
</tr>
<tr>
<td>NOx</td>
<td>50,000</td>
</tr>
<tr>
<td>PM10</td>
<td>30,000</td>
</tr>
<tr>
<td>SOx</td>
<td>80,000</td>
</tr>
</tbody>
</table>

This facility is a major stationary source for VOC which concedes that the Post Project Potential to Emit exceeds the pre-project baseline actual emissions by more than 50,000 lb/year for the emissions units in this project. Therefore, this project is a Major Modification.
8. Federal Major Modification

District Rule 2201, Section 3.17 states that major modifications are also federal major modifications unless they qualify for a "Less-Than-Significant Emissions Increase" exclusion.

A Less-Than-Significant Emissions Increase exclusion is for an emissions increase for the project, or a Net Emissions Increase for the project (as defined in 40 CFR 51.165 (a)(2)(ii)(B) through (D), and (F)), that is not significant for a given regulated NSR pollutant, and therefore is not a federal major modification for that pollutant.

- To determine the post-project projected actual emissions from existing units, the provisions of 40 CFR 51.165 (a)(1)(xxviii) shall be used.

- To determine the pre-project baseline actual emissions, the provisions of 40 CFR 51.165 (a)(1)(xxxv)(A) through (D) shall be used.

- If the project is determined not to be a federal major modification pursuant to the provisions of 40 CFR 51.165 (a)(2)(ii)(B), but there is a reasonable possibility that the project may result in a significant emissions increase, the owner or operator shall comply with all of the provisions of 40 CFR 51.165 (a)(6) and (a)(7).

- Emissions increases calculated pursuant to this section are significant if they exceed the significance thresholds specified in the table below.

<table>
<thead>
<tr>
<th>Significant Threshold (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pollutant</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>VOC</td>
</tr>
<tr>
<td>NOx</td>
</tr>
<tr>
<td>PM_{10}</td>
</tr>
<tr>
<td>SO_{2x}</td>
</tr>
</tbody>
</table>

The Net Emissions Increases (NEI) for purposes of determination of a "Less-Than-Significant Emissions Increase" exclusion will be calculated below to determine if this project qualifies for such an exclusion.

Since this project consists of both existing and new emissions units, the "hybrid test" specified in 40 CFR(a)(2)(ii)(F) is applicable and requires that the NEI determination be based on the sum of the individual NEI determinations for existing emissions units (NEI_E) and new emissions units (NEI_N) pursuant to 40 CFR(a)(2)(ii)(C) and (D) respectively. In addition, pursuant to 40 CFR (a)(1)(vi)(A)(2), creditable contemporaneous emissions increases (NEI_C) must also be included in the determination of the NEI. Therefore,

\[
NEI = NEI_E + NEI_N + NEI_C
\]
**Net Emission Increase for Existing Units (NEI<sub>E</sub>)**

Per 40 CFR 51.165 (a)(1)(xxviii) and 40 CFR 51.165 (a)(2)(ii)(C) for all existing units,

\[ \text{NEI}_E = \text{PAE} - \text{BAE} \]

where,

\[ \text{BAE} = \text{Baseline Actual Emissions which are the actual emissions created by the project during the baseline period. The BAE are calculated pursuant to 40 CFR 51.165 (a)(1)(xxxv)(A) through (D). Based on confidential data and calculations submitted by the facility and verified by the District:} \]

\[ \text{BAE} = 125.28 \text{ tons-VOC/yr} = 250,560 \text{ lb-VOC/yr} \]

\[ \text{PAE} = \text{Projected Actual Emissions which are the post-project projected actual emissions of the existing units in this project pursuant to 40 CFR 51.165 (a)(1)(xxviii). Based on confidential data and calculations submitted by the facility and verified by the District:} \]

\[ \text{PAE} = 160.80 \text{ tons-VOC/yr} = 321,600 \text{ lb-VOC/yr} \]

Per 40 CFR 51.165 (a)(1)(xxvii)(B)(3), the portion of the existing units' emissions following the project that an existing unit *could have accommodated* during the baseline period shall be excluded from the PAE in calculating any emissions increase. Per the applicant, the existing facility could have accommodated 100 percent of the projected maximum annual emissions during the Baseline Period based strictly on increased product demand. The District's analysis of the production capacity of this facility, presented in Section VII.C.1, indicates a production capacity for this facility which is significantly higher than the facility's 10-year projection and thus the District's analysis corroborates the applicant's statements in this regard. Therefore, for this project:

\[ \text{PAE} = \frac{\text{Projected Maximum Annual Emissions}}{\text{Emissions following the project that an existing unit *could have accommodated* during the baseline period}} \]

Since,

\[ \frac{\text{Projected Maximum Annual Emissions}}{\text{Emissions following the project that an existing unit *could have accommodated* during the baseline period}} = 1 \]
PAE = 0

NEIL is thus calculated as follows:

\[ \text{NEIL} = \text{PAE} - \text{BAE} = 0 - \text{BAE} \]

\[ \text{NEIL} = 0 \text{ for all existing emissions units} \]

**Net Emission Increase for New Units (NEIN)**

Per 40 CFR 51.165 (a)(2)(ii)(D) for new emissions units in this project,

\[ \text{NEIN} = \text{PE2N} - \text{BAE} \]

Since these are new units, BAE for these units is zero and,

\[ \text{NEIN} = \text{PE2N} \]

where PE2N is the Post Project Potential to Emit for the new emissions units.

This project includes both new fermentation tank emissions units and new storage tank emissions units. Therefore,

\[ \text{PE2N} = \text{PE2N}(\text{fermentation}) + \text{PE2N}(\text{storage}) \]

As discussed in Appendix D, tanks operating in a winery are not truly independent emissions units, with the result that the theoretical "stand-alone" annual potential to emit for individual tanks cannot be defined (their theoretical annual fermentation/storage capacity, and thus their potential annual emissions, must be established with consideration of all the other associated tanks in the facility).

In order to determine the PE2N(fermentation), a post-project determination of the fermentation emissions of the total (T) number of tanks at the facility (PE2T(fermentation)) must be made which ignores the proposed Specific Limiting Condition which will be placed on the permits. Then the Pre-Project Potential to Emit of the existing (E) operation (PE1E(fermentation)), as determined in Section VII.C) is subtracted from PE2T(fermentation) to arrive at PE2N(fermentation).

PE2T(fermentation) is determined in Appendix K to be 912,516 lb-VOC/year.

PE2N(fermentation) is thus calculated as follows:

\[ \text{PE2N}(\text{fermentation}) = \text{PE2T}(\text{fermentation}) - \text{PE1E}(\text{fermentation}) = 912,516 - 870,294 = 42,222 \text{ lb-VOC/year} \]

In order to determine the PE2N(storage), a post-project determination of the storage emissions of the total (T) number of tanks at the facility (PE2T(storage)) must be made
which ignores the proposed Specific Limiting Condition which will be placed on the permits. Then the Pre-Project Potential to Emit of the existing (E) operation (PE\(_1\)\(_{E(\text{storage})}\)), as determined in Section VII.C) is subtracted from PE\(_2\)\(_{T(\text{storage})}\) to arrive at PE\(_2\)\(_{N(\text{storage})}\).

PE\(_2\)\(_{T(\text{storage})}\) is determined in Appendix K to be 349,700 lb-VOC/year.

PE\(_2\)\(_{N(\text{storage})}\) is thus calculated as follows:

\[
\text{PE}\_2\text{N(\text{storage})} = \text{PE}\_2\text{T(\text{storage})} - \text{PE}\_1\text{E(\text{storage})} = 349,700 - 296,884 = 52,816 \text{ lb-VOC/year}
\]

thus,

\[
\text{PE}\_2\text{N} = \text{PE}\_2\text{N(fermentation)} + \text{PE}\_2\text{N(\text{storage})} = 42,222 + 52,816 = 95,038 \text{ lb-VOC/year}
\]

And,

\[
\text{NEI}_N = \text{PE}\_2\text{N} = 95,038 \text{ lb-VOC/year}
\]

**Creditable Contemporaneous Emissions Increase (NEI\(_C\))**

Creditable contemporaneous emission increases are also associated with this project. These are presented in Appendix L and are as follows:

\[
\text{NEI}_C = 480 \text{ lb-VOC/year}
\]

The NEI for this project is thus calculated as follows:

\[
\text{NEI} = \text{NEI}_E + \text{NEI}_N + \text{NEI}_C
\]

\[
\text{NEI} = 0 + 95,038 + 480 = 95,518 \text{ lb-VOC/year}
\]

The NEI for this project will be greater than the federal Major Modification threshold of 50,000 lb-VOC/year. Therefore, this project does not qualify for a "Less-Than-Significant Emissions Increase" exclusion and is thus determined to be a Federal Major Modification.

**VIII. Compliance**

**Rule 1070  Record keeping**

This rule applies to any source operation, which emits or may emit air contaminants. The rule allows the District to perform inspections for the purpose of obtaining information necessary to determine whether air pollution sources are in compliance with applicable rules and regulations. The rule also allows the District to require record keeping, to make inspections and to conduct tests of air pollution sources.
Record keeping conditions for records required to verify compliance with NSR requirements will be placed on the ATCS under the authority of this rule.

**Rule 2201 New and Modified Stationary Source Review Rule**

**A. Best Available Control Technology (BACT)**

1. **BACT Applicability**

   BACT requirements are triggered on a pollutant-by-pollutant basis and on an emissions unit-by-emissions unit basis for the following*:

   a. Any new emissions unit with a potential to emit exceeding two pounds per day,
   b. The relocation from one Stationary Source to another of an existing emissions unit with a potential to emit exceeding two pounds per day,
   c. Modifications to an existing emissions unit with a valid Permit to Operate resulting in an AIPE exceeding two pounds per day, and/or
   d. Any new or modified emissions unit, in a stationary source project, which results in a Major Modification.

*Except for CO emissions from a new or modified emissions unit at a Stationary Source with an SSPE2 of less than 200,000 pounds per year of CO.

   a. **New emissions units – PE > 2 lb/day**

      The applicant is proposing to install 128 new wine fermentation and storage tanks with a PE greater than 2 lb/day for VOC. Thus BACT is triggered for VOC for these emissions units.

   b. **Relocation of emissions units – PE > 2 lb/day**

      There are no emissions units being relocated from one stationary source to another, hence BACT is not triggered under this category.

   c. **Modification of emissions units – AIPE > 2 lb/day**

      \[ AIPE = PE2 - HAPE \]

      Where,
      \[ AIPE = \text{Adjusted Increase in Permitted Emissions, (lb/day)} \]
      \[ PE2 = \text{Post-Project Potential to Emit, (lb/day)} \]
      \[ HAPE = \text{Historically Adjusted Potential to Emit, (lb/day)} \]

      \[ HAPE = \text{PE1 x (EF2/EF1)} \]

      Where,
PE1 = The emissions unit's Potential to Emit prior to modification or relocation, (lb/day)
EF2 = The emissions unit's permitted emission factor for the pollutant after modification or relocation. If EF2 is greater than EF1 then EF2/EF1 shall be set to 1
EF1 = The emissions unit's permitted emission factor for the pollutant before the modification or relocation

AIPE = PE2 − (PE1 * (EF2 / EF1))

All existing fermentation tanks in this facility are modified by this project. For these emissions units, PE2 = PE1 and EF2 = EF1. Therefore, per the above equation, AIPE = 0 for all modified fermentation emissions units in the project.

Storage tank emissions units 629-2 through 636-2 and 644-2 through 648-2 are modified by this project. The following table calculates the fermentation emissions AIPE for these units:

<table>
<thead>
<tr>
<th>Permit Unit</th>
<th>PE2 lb/day</th>
<th>EF2 lb/1000 gal</th>
<th>PE1 lb/day</th>
<th>EF1 lb/1000 gal</th>
<th>AIPE = PE2 - PE1(EF2/EF1) lb/day</th>
</tr>
</thead>
<tbody>
<tr>
<td>629-2</td>
<td>216.4</td>
<td>3.46</td>
<td>0.0</td>
<td>3.46</td>
<td>216.4</td>
</tr>
<tr>
<td>630-2</td>
<td>216.4</td>
<td>3.46</td>
<td>0.0</td>
<td>3.46</td>
<td>216.4</td>
</tr>
<tr>
<td>631-2</td>
<td>216.4</td>
<td>3.46</td>

<tr>
<td>644-2</td>
<td>21.8</td>
<td>3.46</td>
<td>0.0</td>
<td>3.46</td>
<td>21.8</td>
</tr>
<tr>
<td>645-2</td>
<td>41.8</td>
<td>3.46</td>
<td>0.0</td>
<td>3.46</td>
<td>41.8</td>
</tr>
<tr>
<td>646-2</td>
<td>41.8</td>
<td>3.46</td>
<td>0.0</td>
<td>3.46</td>
<td>41.8</td>
</tr>
<tr>
<td>647-2</td>
<td>41.8</td>
<td>3.46</td>
<td>0.0</td>
<td>3.46</td>
<td>41.8</td>
</tr>
<tr>
<td>648-2</td>
<td>41.8</td>
<td>3.46</td>
<td>0.0</td>
<td>3.46</td>
<td>41.8</td>
</tr>
</tbody>
</table>

As demonstrated above, the AIPE is greater than 2.0 lb/day for VOC emissions for these modified emissions units; therefore BACT is triggered.

d. Major Modification

As discussed in Section VII.C.7 above, this project does constitute a Major Modification for VOC emissions; therefore BACT is triggered for VOC for all emissions units affected by this stationary source project.
2. BACT Guidelines

BACT Guideline 5.4.x, *Wine Fermentation Tanks*, applies to all fermentation tanks in this project. (See Appendix I)

BACT Guideline 5.4.13, *Wine Storage Tanks*, applies to all wine storage tanks in this project. (See Appendix J)

3. Top-Down BACT Analysis

Per Permit Services Policies and Procedures for BACT, a Top-Down BACT analysis shall be performed as a part of the application review for each application subject to the BACT requirements pursuant to the District's NSR Rule.

**Fermentation Tanks**

Pursuant to the attached Top-Down BACT Analysis (see Appendix I), BACT has been satisfied with the following:

**VOC:** Open tank vented to the atmosphere

**Wine Storage Tanks**

Pursuant to the attached Top-Down BACT Analysis (see Appendix J), BACT has been satisfied with the following:

**VOC:** Insulation or Equivalent, Pressure Vacuum Relief Valve (PVRV) set within 10% of the maximum allowable working pressure of the tank; "gas-tight" tank operation; and continuous storage temperature not exceeding 75 oF, achieved within 60 days of completion of fermentation.

The following conditions will be placed on the ATCs to ensure compliance with the requirements of BACT:

**For Stainless Steel Tanks ≥ 5,000 Gallons (Subject to District Rule 4694):**

- When used for wine storage, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rules 2201 and 4694, 5.2.1]

- When this tank is used for wine storage, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rules 2201 and 4694, 5.2.1]
• The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rules 2201 and 4694, 5.2.2] N

For Stainless Steel Tanks < 5,000 Gallons, Concrete and Wood Tanks (Not Subject to District Rule 4694):

• When used for wine storage, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 2201]

• When this tank is used for wine storage, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, as defined in District rule 4694, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 2201] N

• The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rules 1070 and 2201] N

B. Offsets

1. Offset Applicability

Pursuant to Section 4.5.3, offset requirements shall be triggered on a pollutant by pollutant basis and shall be required if the Post Project Stationary Source Potential to Emit (SSPE2) equals to or exceeds the offset threshold levels in Table 4-1 of Rule 2201.

Facility emissions are already above the Offset and Major Source Thresholds for VOC emissions; therefore, offsets are triggered.
2. Quantity of Offsets Required

As discussed above, the facility is an existing Major Source for VOC and the SSPE2 is greater than the offset thresholds; therefore offset calculations will be required for this project.

Per Sections 4.7.1 and 4.7.3, the quantity of offsets in pounds per year for VOC is calculated as follows for sources with an SSPE1 greater than the offset threshold levels before implementing the project being evaluated.

Offsets Required (lb/year) = \( \sum [\text{PE2} - \text{BE} + \text{ICCE}] \times \text{DOR} \), for all new or modified emissions units in the project,

Where,

\( \text{PE2} \) = Post Project Potential to Emit, (lb/year)
\( \text{BE} \) = Baseline Emissions, (lb/year)
\( \text{ICCE} \) = Increase in Cargo Carrier Emissions, (lb/year)
\( \text{DOR} \) = Distance Offset Ratio, determined pursuant to Section 4.8

\( \text{BE} \) = Pre-project Potential to Emit for:
- Any unit located at a non-Major Source,
- Any Highly-Utilized Emissions Unit, located at a Major Source,
- Any Fully-Offset Emissions Unit, located at a Major Source, or
- Any Clean Emissions Unit, Located at a Major Source.

otherwise,

\( \text{BE} \) = Historic Actual Emissions (HAE)

There are no increases in cargo carrier emissions due to this project. Therefore

Offsets Required (lb/year) = \( \sum [\text{PE2} - \text{BE}] \times \text{DOR} = [\sum \text{PE2} - \sum \text{BE}] \times \text{DOR} \)

Per section VIII.C.6, \( \sum \text{BE} = 1,167,178 \text{ lb-VOC/year} \)
Per section VIII.C.2, \( \sum \text{PE2} = 1,167,178 \text{ lb-VOC/year} \)
Offsets Required (lb/year) = \([1,167,178 - 1,167,178] \times \text{DOR} = 0 \text{ lb-VOC/year} \times \text{DOR} = 0 \text{ lb-VOC/year} \)

C. Public Notification

1. Applicability

Public noticing is required for:

a. Any new Major Source, which is a new facility that is also a Major Source,
b. Major Modifications,
c. Any new emissions unit with a Potential to Emit greater than 100 pounds during any one day for any one pollutant,
d. Any project which results in the offset thresholds being surpassed, and/or

e. Any project with an SSIPE of greater than 20,000 lb/year for any pollutant.

a. **New Major Source**

New Major Sources are new facilities, which are also Major Sources. Since this is
not a new facility, public noticing is not required for this project for New Major Source
purposes.

b. **Major Modification**

As demonstrated in VII.C.7, this project is a Major Modification; therefore, public
noticing for Major Modification purposes is required.

c. **PE > 100 lb/day**

Applications which include a new emissions unit with a Potential to Emit greater than
100 pounds during any one day for any pollutant will trigger public noticing
requirements. None of the new emission units included in this project have a daily
PE exceeding 100 lb/day, hence public notice is not triggered under this category.

d. **Offset Threshold**

Since this project concerns only VOC emissions and this facility was a major source
for VOC prior to this project (SSPE > 50,000 lb-VOC/year), the offset threshold was
not surpassed in this project; therefore public noticing is not required for offset
purposes.

e. **SSIPE > 20,000 lb/year**

Public notification is required for any permitting action that results in a Stationary
Source Increase in Permitted Emissions (SSIPE) of more than 20,000 lb/year of any
affected pollutant. According to District policy, the SSIPE is calculated as the Post
Project Stationary Source Potential to Emit (SSPE2) minus the Pre-Project
Stationary Source Potential to Emit (SSPE1), i.e. SSIPE = SSPE2 − SSPE1. This
project concerns only VOC emissions with no increases in annual emissions, as
discussed in Section VII.C.2, hence public notice is not triggered under this
category.

2. **Public Notice Action**

As discussed above, public noticing is required for this project since it is a Major
Modification. Therefore, public notice documents will be submitted to the California
Air Resources Board (CARB) and a public notice will be published in a local
newspaper of general circulation prior to the issuance of the ATC for this equipment.
D. Daily Emission Limits (DELs)

Daily Emissions Limitations (DELs) and other enforceable conditions are required by Section 3.15 to restrict a unit's maximum daily emissions, to a level at or below the emissions associated with the maximum design capacity. Per Sections 3.15.1 and 3.15.2, the DEL must be contained in the latest ATC and contained in or enforced by the latest PTO and enforceable, in a practicable manner, on a daily basis. DELs are also required to enforce the applicability of BACT.

For all fermentation emissions units, the DEL is stated in the form of an emission factor (lb-VOC/day-1000 gallon tank capacity) and the capacity rating of the tank as listed on the permit. These units are also subject to a separate annual emission limit (expressed in lb-VOC per year) in the form of a Specific Limiting Condition (SLC).

For all wine storage tank emissions units affected by this project, the DEL is stated in the form of a daily limit on tank throughput and a maximum ethanol content for wine stored in the tank. These units are also subject to a separate annual emission limits (expressed in lb-VOC per year) in the form of a Specific Limiting Condition (SLC).

**Proposed Rule 2201 (DEL) Conditions:**

Red wine fermentation tanks:

- The daily VOC emissions rate for red wine fermentation shall not exceed 3.46 lb/1000 gallons. [District Rule 2201]

White wine fermentation tanks:

- The daily VOC emissions rate for white wine fermentation shall not exceed 1.62 lb/1000 gallons. [District Rule 2201]

Wine storage tanks: (all units):

- The ethanol content of wine stored in this tank shall not exceed 20 percent by volume. [District Rule 2201]

- When this tank is used for wine storage, the daily tank throughput shall not exceed four times the maximum nominal tank capacity stated on the equipment description. [District Rule 2201]

All tank permits

- Total annual VOC emissions from all wine fermentation and wine storage operations at this facility shall not exceed 1,167,178 lb. [District Rule 2201]

- Total annual VOC emissions from wine fermentation operations shall be determined by the following formula: Total annual VOC emissions = (Total Annual Red Wine
Production-gal) x (6.2 lb-VOC/1000 gal) + (Total Annual White Wine Production-gal) x (2.5 lb-VOC/1000 gal). [District Rule 2201]

- Total annual VOC emissions from wine storage operations may be determined using the total annual wine throughput and a single storage emission factor based on the average ethanol content of the annual wine throughput; or using the throughputs for different batches of wine and batch-specific emission factors based on the ethanol content of each batch. [District Rule 2201]

E. Compliance Assurance

1. Source Testing

Pursuant to District Policy APR 1705, source testing is not required to demonstrate compliance with Rule 2201.

2. Monitoring

No monitoring is required to demonstrate compliance with Rule 2201.

3. Recordkeeping

Recordkeeping is required to demonstrate compliance with the offsets, public notification and daily emission limit requirements of Rule 2201. Recordkeeping is also required for winery tanks pursuant to District Rule 4694, Wine Fermentation and Storage Tanks. The following conditions will be placed on the permits:

Wine Fermentation and Storage Tank Permits:

- The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rules 2201 and 4694, 5.2.2] N

- For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions and fermentation emission reductions (calculated per the emission factors given in District Rule 4694). The information shall be recorded by the tank Permit to Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1] N

- When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2] N
• When this tank is used for wine storage, daily throughput records, including records of filling and emptying operations, the dates of such operations, a unique identifier for each batch, the volume percent ethanol in the batch, and the volume of wine transferred, shall be maintained. [District Rules 1070 and 2201] N

Fermentation-Only Tank Permits

• For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions and fermentation emission reductions (calculated per the emission factors given in District Rule 4694). The information shall be recorded by the tank Permit to Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1] N

Storage-Only Tank Permits:

• The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rules 2201 and 4694, 5.2.2] N

• When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2] N

• When this tank is used for wine storage, daily throughput records, including records of filling and emptying operations, the dates of such operations, a unique identifier for each batch, the volume percent ethanol in the batch, and the volume of wine transferred, shall be maintained. [District Rules 1070 and 2201] N

All Tank permits:

• Records of total annual fermentation and total annual storage emissions, including calculation methods and parameters used, shall be maintained. [District Rule 1070 and 2201] N

• Separate annual records of total red wine and total white wine produced by fermentation at this facility, based on values reported to the Alcohol and Tobacco Tax and Trade Bureau (TTB), U.S. Department of the Treasury, shall be maintained. [District Rules 1070 and 2201]

• All records shall be retained on-site for a period of at least five years and made available for District inspection upon request. [District Rules 1070, 2201 and 4694] N
4. Reporting

No reporting is required to demonstrate compliance with Rule 2201.

F. Ambient Air Quality Analysis

Section 4.14.1 of this Rule requires that an ambient air quality analysis (AAQA) be conducted for the purpose of determining whether a new or modified Stationary Source will cause or make worse a violation of an air quality standard. However, since this project involves only VOC and no ambient air quality standard exists for VOC, an AAQA is not required for this project.

G. Compliance Certification

The compliance certification is required for any project, which constitutes a New Major Source or a Federal Major Modification.

Section 4.15.2 of this Rule requires the owner of a new Major Source or a source undergoing a Title I Modification to demonstrate to the satisfaction of the District that all other Major Sources owned by such person and operating in California are in compliance or are on a schedule for compliance with all applicable emission limitations and standards. As discussed in the preceding sections, this project does constitute a Federal Major Modification, therefore this requirement is applicable.

Included in Appendix M is Constellation Wines U.S.’s compliance certification.

H. Alternative Siting Analysis

Alternative siting analysis is required for any project, which constitutes a New Major Source or a Federal Major Modification.

The current project occurs at an existing winery with a pre-project total wine tank volume of 53,046,559 gallons. The applicant proposes to install new winery tanks totaling 2,146,759 gallons in volume, which represents an increase of 4% of the existing total wine tank volume.

In addition to winery tanks, the operation of a winery requires a large number support equipment, services and structures such as raw material receiving stations, crushers, piping, filtering and refrigeration units, warehouses, laboratories, bottling and shipping facilities, and administration buildings.

Since the current project involves only a minimal increase in the winery's total tank volume and no change to any other facets of the operation, the existing site will result in the least possible impact from the project. Alternative sites would involve the relocation and/or construction of various support structures and facilities on a much greater scale, and would therefore result in a much greater impact.
Rule 2520  Federally Mandated Operating Permits

Pursuant to their current operating permit, this facility is an existing major source. The proposed project constitutes a Significant Modification to the Title V Permit pursuant to Section 3.29. The facility has applied for a Certificate of Conformity (COC), therefore, the facility must apply to modify their Title V permit with an administrative amendment prior to operating with the proposed modifications.

Rule 4001  New Source Performance Standards (NSPS)

This rule incorporates NSPS from Part 60, Chapter 1, Title 40, Code of Federal Regulations (CFR); and applies to all new sources of air pollution and modifications of existing sources of air pollution listed in 40 CFR Part 60. However, no subparts of 40 CFR Part 60 apply to wine fermentation and storage tank operations.

Rule 4002  National Emission Standards for Hazardous Air Pollutants (NESHAPs)

This rule incorporates NESHAPs from Part 61, Chapter I, Subchapter C, Title 40, CFR and the NESHAPs from Part 63, Chapter I, Subchapter C, Title 40, CFR; and applies to all sources of hazardous air pollution listed in 40 CFR Part 61 or 40 CFR Part 63. However, no subparts of 40 CFR Part 61 or 40 CFR Part 63 apply to wine fermentation and storage tank operations.

Rule 4102  Nuisance

Rule 4102 states that no air contaminant shall be released into the atmosphere which causes a public nuisance. Public nuisance conditions are not expected as a result of the proposed operations provided the equipment is well maintained. Therefore, the following condition will be listed on each permit to ensure compliance:

- {98} No air contaminant shall be released into the atmosphere which causes a public nuisance. [District Rule 4102]

California Health & Safety Code 41700  (Health Risk Assessment)

District Policy APR 1905 – Risk Management Policy for Permitting New and Modified Sources specifies that for an increase in hazardous air pollutants (HAP) associated with a proposed new source or modification, the District perform an analysis to determine the possible impact to the nearest resident or worksite.

Ethanol is not a HAP as defined by Section 44321 of the California Health and Safety Code. Therefore, there are no increases in HAP emissions associated with any emission units in this project, therefore a health risk assessment is not necessary and no further risk analysis is required.

District Rule 4694  Wine Fermentation and Storage Tanks

The purpose of this rule is to reduce emissions of volatile organic compounds (VOC) from the fermentation and bulk storage of wine, or achieve equivalent reductions from alternative emission sources. This rule is applicable to all facilities with fermentation emissions in excess
of 10 tons-VOC/year. The storage tank provisions of this rule apply to all tanks with capacity in excess of 5,000 gallons.

Section 5.1 requires the winery operator achieve Required Annual Emissions Reductions (RAER) equal to at least 35% of the winery's Baseline Fermentation Emissions (BFE). Per the definition of RAER in Section 3.25 of the Rule, the RAER may be achieved by any combination of Fermentation Emission Reductions (FER), Certified Emission Reductions (CER) or District Obtained Emission Reductions (DOER) as established in the facility's District-approved Rule 4694 Compliance Plan, due every three years on December 1st beginning in 2006. The facility has submitted the required plan to the District and is currently satisfying the required emission reductions in the form of Certified Emission Reductions.

The following condition on the facility-wide permit (unit 0-1) ensures compliance:

- The winery operator shall achieve required annual emissions reductions (RAER) equal to at least 35% of the winery's baseline fermentation emissions (BFE) [District Rule 4694] N

Section 5.2 places specific restrictions on wine storage tanks with 5,000 gallons or more in capacity when such tanks are not constructed of wood or concrete. Section 5.2.1 requires these tanks to be equipped and operated with a pressure-vacuum relief valve meeting all of the following requirements:

- The pressure-vacuum relief valve shall operate within 10% of the maximum allowable working pressure of the tank,
- The pressure-vacuum relief valve shall operate in accordance with the manufacturer's instructions, and
- The pressure-vacuum relief valve shall be permanently labeled with the operating pressure settings.
- The pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21.

The following conditions will be placed on the permits for stainless steel tanks ≥ 5,000 gallons in capacity to ensure compliance with the requirements of Section 5.2.1:

- When used for wine storage, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rules 2201 and 4694, 5.2.1] N

- When this tank is used for wine storage, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rules 2201 and 4694, 5.2.1] N
Section 5.2.2 requires that the temperature of the stored wine be maintained at or below 75°F.

The following condition will be placed on the permits for stainless steel tanks ≥ 5,000 gallons in capacity to ensure compliance with the requirements of Section 5.2.2:

- The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rules 2201 and 4694, 5.2.2] N

Every three years, Section 6.1 and 6.2 require the facility to submit a Three-Year Compliance Plan and a Three-Year Compliance Plan Verification respectively. Section 6.3 requires that an Annual Compliance Plan Demonstration be submitted to the District no later than February 1 of each year to show compliance with the applicable requirements of the Rule. Section 6.4.3 requires that all monitoring be performed for any Certified Emission Reductions as identified in the facility’s Three-Year Compliance Plan and that the records of all monitoring be maintained.

The following conditions on the facility-wide permit (unit 0-1) ensure compliance:

- By December 1, 2006, and every three years thereafter, the winery operator subject to the requirements of Section 5.1 shall submit to the District a three-year compliance plan that demonstrates compliance with the applicable requirements of District Rule 4694 for each year of the applicable compliance period. The three-year compliance plan shall include all the information specified in sections 6.1.1 through 6.1.8 of the rule. [District Rule 4694, 6.1] N

- By July 1, 2007, and every three years thereafter, the winery operator shall submit to the District a three-year compliance plan verification that demonstrates that the three-year compliance plan elements are in effect. The compliance plan verification shall include all the information specified in sections 6.2.1 through 6.2.5 of District Rule 4694. [District Rule 4694, 6.2] N

- By February 1, 2008, and every year thereafter, the winery operator shall submit to the District an annual compliance plan demonstration that shows compliance with the applicable requirements of District Rule 4694. The compliance plan demonstration shall include all the information specified in sections 6.3.1 through 6.3.7 of the rule. All additional Required Annual Emissions Reductions (RAER) shall be obtained by April 1 of the year of the Annual Compliance Demonstration, per section 6.3.7.2 of the rule. [District Rule 4694, 6.3] N

- Operators using CER to mitigate fermentation emissions shall perform all monitoring and recordkeeping, as established in their approved Three-Year Compliance Plan, and shall maintain all records necessary to demonstrate compliance. [District Rule 4694]
Section 6.4.1 requires that records be kept for each fermentation batch. The following condition will be placed on the permits for each fermentation tank to ensure compliance with the requirements of Section 6.4.1.

- For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emissions reductions. The information shall be recorded by the tank Permit to Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1] N

Section 6.4.2 requires that weekly records be kept of wine volume and temperature in each storage tank. The following conditions will be placed on the permit for each storage tank to ensure compliance with the requirements of Section 6.4.2:

- When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2] N

Section 6.4 requires that records required by this rule be maintained, retained on-site for a minimum of five years, and made available to the APCO upon request. The following conditions will be placed on all permits to ensure compliance:

- All records shall be retained on-site for a period of at least five years and made available for District inspection upon request. [District Rules 1070, 2201 and 4694] N

California Health & Safety Code 42301.6 (School Notice)

The District has verified that this site is not located within 1,000 feet of a school. Therefore, pursuant to California Health and Safety Code 42301.6, a school notice is not required.

California Environmental Quality Act (CEQA)

The California Environmental Quality Act (CEQA) requires each public agency to adopt objectives, criteria, and specific procedures consistent with CEQA Statutes and the CEQA Guidelines for administering its responsibilities under CEQA, including the orderly evaluation of projects and preparation of environmental documents. The San Joaquin Valley Unified Air Pollution Control District (District) adopted its Environmental Review Guidelines (ERG) in 2001. The basic purposes of CEQA are to:

- Inform governmental decision-makers and the public about the potential, significant environmental effects of proposed activities.
- Identify the ways that environmental damage can be avoided or significantly reduced.
- Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible.
• Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

The District performed an Engineering Evaluation (this document) for the proposed project and determined that the activity will occur at an existing facility and the project involves negligible expansion of the existing use. Furthermore, the District determined that the activity will not have a significant effect on the environment. The District finds that the activity is categorically exempt from the provisions of CEQA pursuant to CEQA Guideline § 15031 (Existing Facilities), and finds that the project is exempt per the general rule that CEQA applies only to projects which have the potential for causing a significant effect on the environment (CEQA Guidelines §15061(b)(3)).

IX. Recommendation

Compliance with all applicable rules and regulations is expected. Pending a successful NSR Public Noticing period, issue the proposed Authorities to Construct subject to the permit conditions on the attached draft Authorities to Construct in Appendix O.

X. Billing Information

Billing information is listed in Appendix N.

XI. Appendices

A: Current PTOs
B: Pre-Project Equipment Descriptions
C: ATC Equipment Descriptions
D: Draft Policy for Calculation of Winery Emissions
E: Daily PE1 for Fermentation Tank Emissions Units
F: Daily PE1 for Storage Tank Emissions Units
G: Daily PE2 for Fermentation Tank Emissions Units – New Tanks and Storage-Only Tanks Modified to Allow Fermentation
H: Daily PE2 for Storage Tank Emissions Units – New Tanks
I: BACT Guideline and Top-Down Analysis for Wine Fermentation Tanks
J: BACT Guideline 5.4.13 and Top-Down Analysis for Wine Storage Tanks
K: Calculation of Post Project Potential to Emit Under Non-SLC Scenario
L: Contemporaneous Emissions
M: Compliance Certification
N: Billing Information
O: Draft ATCs
Appendix A

Current PTOs
1. The owner or operator shall notify the District of any breakdown condition as soon as reasonably possible, but no later than one hour after its detection, unless the owner or operator demonstrates to the District's satisfaction that the longer reporting period was necessary. [District Rule 1100, 6.1; County Rules 110 (Fresno, Stanislaus, San Joaquin); 109 (Merced); 113 (Madera); and 111 (Kern, Tulare, Kings)] Federally Enforceable Through Title V Permit

2. The District shall be notified in writing within ten days following the correction of any breakdown condition. The breakdown notification shall include a description of the equipment malfunction or failure, the date and cause of the initial failure, the estimated emissions in excess of those allowed, and the methods utilized to restore normal operations. [District Rule 1100, 7.0; County Rules 110 (Fresno, Stanislaus, San Joaquin); 109 (Merced); 113 (Madera); and 111 (Kern, Tulare, Kings)] Federally Enforceable Through Title V Permit

3. The owner or operator of any stationary source operation that emits more than 25 tons per year of nitrogen oxides or reactive organic compounds, shall provide the District annually with a written statement in such form and at such time as the District prescribes, showing actual emissions of nitrogen oxides and reactive organic compounds from that source. [District Rule 1160, 5.0] Federally Enforceable Through Title V Permit

4. Any person building, altering or replacing any operation, article, machine, equipment, or other contrivance, the use of which may cause the issuance of air contaminants or the use of which may eliminate, reduce, or control the issuance of air contaminants, shall first obtain an Authority to Construct (ATC) from the District unless exempted by District Rule 2020 (3/21/02). [District Rule 2010, 3.0 and 4.0; and 2020] Federally Enforceable Through Title V Permit

5. The permittee must comply with all conditions of the permit including permit revisions originated by the District. All terms and conditions of a permit that are required pursuant to the Clean Air Act (CAA), including provisions to limit potential to emit, are enforceable by the EPA and Citizens under the CAA. Any permit noncompliance constitutes a violation of the CAA and the District Rules and Regulations, and is grounds for enforcement action, for permit termination, revocation, reopening and reissuance, or modification; or for denial of a permit renewal application. [District Rules 2070, 7.0; 2080; and 2520, 9.8.1 and 9.12.1] Federally Enforceable Through Title V Permit

6. A Permit to Operate or an Authority to Construct shall not be transferred unless a new application is filed with and approved by the District. [District Rule 2031] Federally Enforceable Through Title V Permit

7. Every application for a permit required under Rule 2010 (12/17/92) shall be filed in a manner and form prescribed by the District. [District Rule 2040] Federally Enforceable Through Title V Permit

8. The operator shall maintain records of required monitoring that include: 1) the date, place, and time of sampling or measurement; 2) the date(s) analyses were performed; 3) the company or entity that performed the analysis; 4) the analytical techniques or methods used; 5) the results of such analysis; and 6) the operating conditions at the time of sampling or measurement. [District Rule 2520, 9.4.1] Federally Enforceable Through Title V Permit

9. The operator shall retain records of all required monitoring data and support information for a period of at least 5 years from the date of the monitoring sample, measurement, or report. Support information includes copies of all reports required by the permit and, for continuous monitoring instrumentation, all calibration and maintenance records and all original strip-chart recordings. [District Rule 2520, 9.4.2] Federally Enforceable Through Title V Permit
10. The operator shall submit reports of any required monitoring at least every six months unless a different frequency is required by an applicable requirement. All instances of deviations from permit requirements must be clearly identified in such reports. [District Rule 2520, 9.5.1] Federally Enforceable Through Title V Permit

11. Deviations from permit conditions must be promptly reported, including deviations attributable to upset conditions, as defined in the permit. For the purpose of this condition, promptly means as soon as reasonably possible, but no later than 10 days after detection. The report shall include the probable cause of such deviations, and any corrective actions or preventive measures taken. All required reports must be certified by a responsible official consistent with section 10.0 of District Rule 2520 (6/21/01). [District Rules 2520, 9.5.2 and 1100, 7.0] Federally Enforceable Through Title V Permit

12. If for any reason a permit requirement or condition is being challenged for its constitutionality or validity by a court of competent jurisdiction, the outcome of such challenge shall not affect or invalidate the remainder of the conditions or requirements in that permit. [District Rule 2520, 9.7] Federally Enforceable Through Title V Permit

13. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of the permit. [District Rule 2520, 9.8.2] Federally Enforceable Through Title V Permit

14. The permit may be modified, revoked, reopened and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition. [District Rule 2520, 9.8.3] Federally Enforceable Through Title V Permit

15. The permit does not convey any property rights of any sort, or any exclusive privilege. [District Rule 2520, 9.8.4] Federally Enforceable Through Title V Permit

16. The Permittee shall furnish to the District, within a reasonable time, any information that the District may request in writing to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit or to determine compliance with the permit. Upon request, the permittee shall also furnish to the District copies of records required to be kept by the permit or, for information claimed to be confidential, the permittee may furnish such records directly to EPA along with a claim of confidentiality. [District Rule 2520, 9.8.5] Federally Enforceable Through Title V Permit

17. The permittee shall pay annual permit fees and other applicable fees as prescribed in Regulation III of the District Rules and Regulations. [District Rule 2520, 9.9] Federally Enforceable Through Title V Permit

18. Upon presentation of appropriate credentials, a permittee shall allow an authorized representative of the District to enter the permittee's premises where a permitted source is located or emissions related activity is conducted, or where records must be kept under condition of the permit. [District Rule 2520, 9.13.2.1] Federally Enforceable Through Title V Permit

19. Upon presentation of appropriate credentials, a permittee shall allow an authorized representative of the District to have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit. [District Rule 2520, 9.13.2.2] Federally Enforceable Through Title V Permit

20. Upon presentation of appropriate credentials, a permittee shall allow an authorized representative of the District to inspect at reasonable times any facilities, equipment, practices, or operations regulated or required under the permit. [District Rule 2520, 9.13.2.3] Federally Enforceable Through Title V Permit

21. Upon presentation of appropriate credentials, a permittee shall allow an authorized representative of the District to sample or monitor, at reasonable times, substances or parameters for the purpose of assuring compliance with the permit or applicable requirements. [District Rule 2520, 9.13.2.4] Federally Enforceable Through Title V Permit

22. No air contaminants shall be discharged into the atmosphere for a period or periods aggregating more than 3 minutes in any one hour which is as dark or darker than Ringelmann #1 or equivalent to 20% opacity and greater, unless specifically exempted by District Rule 4101 (11/15/01). If the equipment or operation is subject to a more stringent visible emission standard as prescribed in a permit condition, the more stringent visible emission limit shall supersede this condition. [District Rule 4101, and County Rules 401 (in all eight counties in the San Joaquin Valley)] Federally Enforceable Through Title V Permit
23. No person shall manufacture, blend, repackage, supply, sell, solicit or apply any architectural coating with a VOC content in excess of the corresponding limit specified in the Table of Standards of District Rule 4601 (10/31/01) for use or sale within the District. [District Rule 4601, 5.1] Federally Enforceable Through Title V Permit

24. All VOC-containing materials for architectural coatings subject to Rule 4601 (10/31/01) shall be stored in closed containers when not in use. [District Rule 4601, 5.4] Federally Enforceable Through Title V Permit

25. The permittee shall comply with all the Labeling and Test Methods requirements outlined in Rule 4601 sections 6.1 and 6.3 (10/31/01). [District Rule 4601, 6.1 and 6.3] Federally Enforceable Through Title V Permit

26. With each report or document submitted under a permit requirement or a request for information by the District or EPA, the permittee shall include a certification of truth, accuracy, and completeness by a responsible official. [District Rule 2520, 9.13.1 and 10.0] Federally Enforceable Through Title V Permit

27. If the permittee performs maintenance on, or services, repairs, or disposes of appliances, the permittee shall comply with the standards for Recycling and Emissions Reduction pursuant to 40 CFR 82, Subpart F. [40 CFR 82 Subpart F] Federally Enforceable Through Title V Permit

28. If the permittee performs service on motor vehicles when this service involves the ozone-depleting refrigerant in the motor vehicle air conditioner (MVAC), the permittee shall comply with the standards for Servicing of Motor Vehicle Air Conditioners pursuant to all the applicable requirements as specified in 40 CFR 82, Subpart B. [40 CFR 82, Subpart B] Federally Enforceable Through Title V Permit

29. Disturbances of soil related to any construction, demolition, excavation, extraction, or other earthmoving activities shall comply with the requirements for fugitive dust control in District Rule 8021 unless specifically exempted under Section 4.0 of Rule 8021 (11/15/01) or Rule 8011 (11/15/01). [District Rule 8021 and 8011] Federally Enforceable Through Title V Permit

30. Outdoor handling, storage and transport of any bulk material which emits dust shall comply with the requirements of District Rule 8031, unless specifically exempted under Section 4.0 of Rule 8031 (11/15/01) or Rule 8011 (11/15/01). [District Rule 8031 and 8011] Federally Enforceable Through Title V Permit

31. An owner/operator shall prevent or cleanup any carryout or trackout in accordance with the requirements of District Rule 8041 Section 5.0, unless specifically exempted under Section 4.0 of Rule 8041 (11/15/01) or Rule 8011 (11/15/01). [District Rule 8041 and 8011] Federally Enforceable Through Title V Permit

32. Whenever open areas are disturbed or vehicles are used in open areas, the facility shall comply with the requirements of Section 5.0 of District Rule 8051, unless specifically exempted under Section 4.0 of Rule 8051 (11/15/01) or Rule 8011 (11/15/01). [District Rule 8051 and 8011] Federally Enforceable Through Title V Permit

33. Any paved road or unpaved road shall comply with the requirements of District Rule 8061 unless specifically exempted under Section 4.0 of Rule 8061 (11/15/01) or Rule 8011 (11/15/01). [District Rule 8061 and Rule 8011] Federally Enforceable Through Title V Permit

34. Any unpaved vehicle/equipment area that anticipates more than 75 vehicle trips per day shall comply with the requirements of Section 5.1.1 of District Rule 8071. Any unpaved vehicle/equipment area that anticipates more than 100 vehicle trips per day shall comply with the requirements of Section 5.1.2 of District Rule 8071. All sources shall comply with the requirements of Section 5.0 of District Rule 8071 unless specifically exempted under Section 4.0 of Rule 8071 (11/15/01) or Rule 8011 (11/15/01). [District Rule 8071 and Rule 8011] Federally Enforceable Through Title V Permit

35. Any owner or operator of a demolition or renovation activity, as defined in 40 CFR 61.141, shall comply with the applicable inspection, notification, removal, and disposal procedures for asbestos containing materials as specified in 40 CFR 61.145 (Standard for Demolition and Renovation). [40 CFR 61 Subpart M] Federally Enforceable Through Title V Permit
36. The permittee shall submit certifications of compliance with the terms and standards contained in Title V permits, including emission limits, standards and work practices, to the District and the EPA annually (or more frequently as specified in an applicable requirement or as specified by the District). The certification shall include the identification of each permit term or condition, the compliance status, whether compliance was continuous or intermittent, the methods used for determining the compliance status, and any other facts required by the District to determine the compliance status of the source. [District Rule 2520, 9.16] Federally Enforceable Through Title V Permit

37. The permittee shall submit an application for Title V permit renewal to the District at least six months, but not greater than 18 months, prior to the permit expiration date. [District Rule 2520, 5.2] Federally Enforceable Through Title V Permit

38. When a term is not defined in a Title V permit condition, the definition in the rule cited as the origin and authority for the condition in a Title V permits shall apply. [District Rule 2520, 9.1.1] Federally Enforceable Through Title V Permit

39. Compliance with permit conditions in the Title V permit shall be deemed in compliance with the following outdated SIP requirements: Rule 401 (Madera, Fresno, Kern, Kings, San Joaquin, Stanislaus, Tulare and Merced), Rule 110 (Fresno, Stanislaus, San Joaquin), Rule 109 (Merced), Rule 113 (Madera), and Rule 111 (Kern, Tulare, Kings). A permit shield is granted from these requirements. [District Rule 2520, 13.2] Federally Enforceable Through Title V Permit

40. Compliance with permit conditions in the Title V permit shall be deemed in compliance with the following applicable requirements: SJVUAPCD Rules 1100, sections 6.1 and 7.0 (12/17/92); 2010, sections 3.0 and 4.0 (12/17/92); 2031 (12/17/92); 2040 (12/17/92); 2070, section 7.0 (12/17/92); 2080 (12/17/92); 4101 (11/15/01); 4601, sections 5.1, 5.2, 5.3, 5.8 and 8.0 (10/31/01); 8021 (11/15/01); 8031 (11/15/01); 8041 (11/15/01); 8051 (11/15/01); 8061 (11/15/01); and 8071 (11/15/01). A permit shield is granted from these requirements. [District Rule 2520, 13.2] Federally Enforceable Through Title V Permit

41. On March 31, 2007, the initial Title V permit was issued. The reporting periods for the Report of Required Monitoring and the Compliance Certification Report are based upon this initial permit issuance date, unless alternative dates are approved by the District Compliance Division. These reports are due within 30 days after the end of the reporting period. [District Rule 2520] Federally Enforceable Through Title V Permit

42. No air contaminant shall be released into the atmosphere which causes a public nuisance. [District Rule 4102]

43. The winery operator shall achieve required annual emissions reductions (RAER) equal to at least 35% of the winery's baseline fermentation emissions (BFE) [District Rule 4694]

44. By December 1, 2006, and every three years thereafter, the winery operator subject to the requirements of Section 5.1 shall submit to the District a three-year compliance plan that demonstrates compliance with the applicable requirements of District Rule 4694 for each year of the applicable compliance period. The three-year compliance plan shall include all the information specified in sections 6.1.1 through 6.1.8 of the rule. [District Rule 4694, 6.1]

45. By July 1, 2007, and every three years thereafter, the winery operator shall submit to the District a three-year compliance plan verification that demonstrates that the three-year compliance plan elements are in effect. The compliance plan verification shall include all the information specified in sections 6.2.1 through 6.2.5 of District Rule 4694. [District Rule 4694, 6.2]

46. By February 1, 2008, and every year thereafter, the winery operator shall submit to the District an annual compliance plan demonstration that shows compliance with the applicable requirements of District Rule 4694. The compliance plan demonstration shall include all the information specified in sections 6.3.1 through 6.3.7 of the rule. All additional Required Annual Emissions Reductions (RAER) shall be obtained by April 1 of the year of the Annual Compliance Demonstration, per section 6.3.7.2 of the rule. [District Rule 4694, 6.3]

47. Operators using certified emission reductions (CER) to mitigate fermentation emissions shall perform all monitoring and recordkeeping, as established in their approved three-year compliance plan, and shall maintain all records necessary to demonstrate compliance. [District Rule 4694]

48. Payment of District Obtained Emissions Reductions (DOER) and administrative fees shall be made to the District no later than March 1, of the first year in the applicable compliance period. [District Rule 4694, 6.1.5.3.5]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT REQUIREMENTS

1. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emissions reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

2. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

EQUIPMENT DESCRIPTION:
26,470 GALLON CONCRETE RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 2

PERMIT UNIT REQUIREMENTS

1. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emissions reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

2. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

PERMIT UNIT: N-2321-50-1
EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
20,518 GALLON REDWOOD RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 41

PERMIT UNIT REQUIREMENTS

1. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emissions reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

2. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT REQUIREMENTS

1. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emissions reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

2. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emissions reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

2. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

EQUIPMENT DESCRIPTION:
60,259 GALLON CONCRETE RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 110

PERMIT UNIT REQUIREMENTS

1. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emissions reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

2. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
6,969 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 125 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

PERMIT UNIT: N-2321-132-1
EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
5,063 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 300 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. EQUIPMENT DESCRIPTION:
216,830 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 401 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emissions reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-155-1
EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
216,830 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE
STORAGE TANK 405 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall
operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the
manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694,

For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT: N-2321-172-1  EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
16,118 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 508 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT: N-2321-220-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
39,798 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 572 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-236-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
16,118 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 702 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-274-1
EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
40,697 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 756 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-290-1
EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
11,150 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 808 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

[District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-307-1
EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
19,700 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 905 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

[District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-323-1

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-340-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
216,830 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1116 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT: N-2321-356-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
216,830 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1132 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

STORAGE TANK 1148 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall
operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the
manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694,
5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight
condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be
determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694,
5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature
of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall
achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and
shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved.
[District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total
gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The
information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or
white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine
contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

PERMIT UNIT: N-2321-388-1
EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
108,774 GALLON STAINLESS STEEL ENCLODED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1166 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT: N-2321-389-1  EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
108,774 GALLON STAINLESS STEEL ENCLODED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1167 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. 4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]  

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
San Joaquin Valley
Air Pollution Control District

[District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-448-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
62,554 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1224 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-463-1
EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
62,554 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1239 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

[District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

[District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

[District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-511-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
216,830 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1305 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

   of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall
   achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and
   shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved.
   [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total
   gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The
   information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or
   white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine
   contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

[District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
EQUIPMENT DESCRIPTION:
216,830 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1502 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
San Joaquin Valley
Air Pollution Control District

A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
EQUIPMENT DESCRIPTION:
216,830 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE
STORAGE TANK 1520 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall
   operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the
   manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694,
   5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight
   condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be
   determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694,
   5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature
   of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall
   achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and
   shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved.
   [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total
   gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The
   information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or
   white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine
   contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]
PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. 4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-593-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
62,554 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1603 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

[District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
San Joaquin Valley
Air Pollution Control District

PERMIT UNIT: N-2321-609-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
62,554 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1631 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT: N-2321-624-1

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
62,554 GALLON STAINLESS STEEL ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 1658 WITH PRESSURE/VACUUM VALVE

PERMIT UNIT REQUIREMENTS

1. When storing wine, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 4694, 5.2.1]

2. When this tank is used for storing wine, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 4694, 5.2.1]

3. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 4694, 5.2.2]

4. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, uncontrolled fermentation emissions, and fermentation emission reductions. The information shall be recorded by the tank Permit To Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

5. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

These terms and conditions are part of the Facility-wide Permit to Operate.

EXPIRATION DATE: 08/31/2011

EQUIPMENT DESCRIPTION:
6,287 GALLON STAINLESS STEEL ENCLOSED TOP WINE STORAGE TANK 941 WITH PRESSURE/VACUUM VALVE AND INSULATION

PERMIT UNIT REQUIREMENTS

1. The wine storage tank shall be equipped and operated with a pressure-vacuum relief valve, set to operate within 10% of the maximum allowable working pressure of the tank and permanently labeled with the operating pressure settings. [District Rules 2201 and 4694] Federally Enforceable Through Title V Permit

2. The pressure-vacuum relief valve shall be installed and operated in accordance with the manufacturer's instructions. [District Rules 2201 and 4694] Federally Enforceable Through Title V Permit

3. The pressure-vacuum relief valve and wine storage tank shall remain in a gas-tight condition except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rules 2201 and 4694] Federally Enforceable Through Title V Permit

4. The temperature of each batch of wine placed, stored, or held in the tank shall not exceed 75 degrees F after 60 days following completion of fermentation. [District Rule 4694] Federally Enforceable Through Title V Permit

5. Ethanol content of wine in this tank shall not exceed 14 percent by volume. [District Rule 2201] Federally Enforceable Through Title V Permit

6. Tank throughput shall not exceed either of the following limits: 13,000 gallons in any one day or 1,650,000 gallons per year. [District Rule 2201] Federally Enforceable Through Title V Permit

7. The maximum temperature of each batch of wine placed, stored, or held in the tank shall be recorded weekly. [District Rule 4694] Federally Enforceable Through Title V Permit

8. Records of filling and emptying operations shall be kept for this tank including the date of the operation, a unique identifier for each batch, the volume percent ethanol in the batch and the volume of wine transferred. [District Rules 2201 and 4694] Federally Enforceable Through Title V Permit

9. The wine batch identifier and volume stored in the tank shall be recorded weekly. [District Rule 4694] Federally Enforceable Through Title V Permit

10. Daily and annual records of tank throughput shall be kept. [District Rule 2201] Federally Enforceable Through Title V Permit

These terms and conditions are part of the Facility-wide Permit to Operate.
PERMIT UNIT REQUIREMENTS

Appendix D

Draft Policy for Calculation of Winery Emissions
TO: Permit Services Division Staff
FROM: Dennis Roberts
DATE: June 30, 2009

SUBJECT: Calculation of the Potential to Emit for VOC Emissions from Wine Fermentation and Storage Operations

Purpose
The purpose of this policy is to establish a framework for calculating the collective Potential to Emit for VOCs from wine fermentation and storage tanks which have been previously permitted by in-house Permits to Operate based on loss-of-exemption. Such calculation is primarily performed for purposes of establishing the collective Pre-Project Potential to Emit (PE1) to form the basis for a Specific Limiting Condition (SLC) on all wine tanks at a facility which limits PE2 = PE1.

Applicability
This policy applies to all wine fermentation and storage operations.

Background
The District began issuing permits for wine fermentation and storage tanks on August 21, 2005. In-house PTO's were issued for existing tanks based on a loss or exemption and therefore the tank permits were not subject to New Source Review. Currently, majority of all wine tank permits in the San Joaquin Valley are in-house PTO’s and thus do not contain emission limits such as they would have if subjected to New Source Review (NSR).

Due to changing consumer tastes, the wine industry in the San Joaquin Valley is changing from the production of wines typically made in large tanks to the production of wine in smaller tanks, using smaller batches of select grapes and smaller fermentation batch sizes, with the objective of producing higher quality wines. To produce the same volume of wine in this manner requires more tanks and smaller tanks. Permitting of additional new, smaller wine fermentation and storage tanks could require the purchase of emissions offsets, even in those cases when a winery is just changing to smaller lot production and overall production is not increasing. Where all tanks meet the requirements for Best Available Control Technology (BACT), a potential permitting approach for adding tanks to a facility, for purposes of product flexibility and without triggering offsets, is to establish an SLC on all the tanks which limits the collective annual PE2 to the calculated collective PE1 for all the existing tanks. Since all units meet BACT, Baseline Emissions (BE) are equal to PE1 and calculated offsets are thus zero pursuant to Rule 2201.

The tanks at a winery are highly interdependent in operation and in the absence of a pre-established permit limit they cannot be considered as independent emissions units. By their nature, the various tank operations which convert crushed grapes into finished wine (fermentation, pressing, racking, filtration, etc.) cannot be all conducted in a single tank. In addition, other associated equipment such as that required for
crushing and pressing may serve to limit wine production by the facility. Therefore, a
calculation of the PE for wine tanks requires that the tanks be considered in terms of
a collective wine production capacity and that other production bottlenecks such as
crushing and pressing limitations also be considered. This policy provides a
theoretical basis and methodology for performing such a calculation.

Wine Production Process Description

- The VOC emissions associated with winemaking are produced from two
  separate operations:

  1. Wine Fermentation (a chemical reaction process which converts sugar
     into ethanol)

  2. Storage Tank Operations during which post-fermentation operations such
     as racking, cold stabilization, filtration, etc., are also conducted.

   Typically, all tanks in a winery are used for both purposes; thus a wine tank
   commonly consists of two separate emissions units.

- A general process description for wine production is given in U.S. EPA AP-42
  Section 9.12.2. There are many variations to the basic process that reflect the
  individuality of the winemaking and which may be considered proprietary at most
  facilities. Some additions to the AP-42 description: White wines are fermented
  without the grape solids, which minimizes the amount of solids settling out in the
  fermentation tank, allowing white wine to potentially be fermented in any wine
  tank.

- Red wine is generally fermented with the grape solids which give the red color
  and other distinctive characteristics to the wine. Because of the solids settling
  out with red wine fermentation, specialized red wine fermentation tanks with
  sloped bottoms or constructed as a horizontal rotating drums are generally used
  to ease solids removal during tank cleaning.

- The tanks in a winery are highly interdependent in operation and therefore must
  be considered in terms of the collective production capacity. The fermentation
  capacity of a facility is not only a function of the capacity of the tanks actually
  performing fermentation but is also a function of the downstream storage tank
  capacity which may serve to bottleneck the upstream fermentation operation.
  The wine production process flow diagram in U.S. EPA AP-42 Figure 9.12.2.-1 is
  illustrative. Post fermentation operations such as cold stabilization, filtration,
  malolactic fermentation, etc., have historically required a post fermentation
  residence time in storage tanks of 40 days or less.

- The facility's grape crushing/destemming and pressing equipment may serve to
  bottleneck the overall operation, establishing the PE by limiting daily throughput
  of the facility or of individual fermentation tanks.

- Wine production in the San Joaquin Valley is a seasonal event, coinciding with
  the grape harvest season ("crush season"). Wine production typically occurs in
  the months of August through December. Fermentation is at its peak during
September through October; about 74% of wine fermentation occurs within those months in the San Joaquin Valley.

**Basis and Assumptions for PE Calculation**

- Since the annual emissions from a winery operation are proportional to the annual wine production, the basic approach for calculating the PE for a winery operation is to determine the limiting factor for wine production at the facility and base the calculation on this factor. The following items are considered in determination of the actual "bottleneck" to wine production at a facility:

  **Grape Crushing/Destemming Capacity:** Daily production is limited by the facility's capacity to receive and crush grapes. This capacity is established by the manufacturer's rated crushing capacity in tons per hour for the crushing equipment actually located at the facility.

  **Wine Pressing Capacity:** Following crushing, the grape skins must be separated from the wine in the presses. For white wines, this occurs immediately after crushing. For red wines, pressing is performed after the fermentation step. This capacity is established by the manufacturer's rated pressing capacity in tons per hour for the pressing equipment actually located at the facility.

  **Winery Tank Capacity:** Due to the highly inter-related operation of winery tanks, the collective production capacity of winery tankage, in terms of a required collective "minimum residence time" for wine processing, is the basis for the calculation rather than a consideration of the sum of individual theoretical production capacities for each tank. The capacity of the available tankage to produce both red and white wines is considered separately and the scenario which produces the highest potential emissions is considered to be the facility's basis for calculating the PE based on storage tanks limitations.

- The crushing of grapes is assumed to produce 200 gallons of produced wine based on data provided by The Wine Institute.

- Batch fermentation processing is assumed to require a 5 day turnaround for a red wine fermentation tank and a 10 day turnaround for white wine, i.e., a red wine fermenter can produce a batch every 5 days while a white wine fermenter can produce a batch every 10 days. These durations were previously established as a result of information provided by the Wine Institute during development of District Rule 4694 – *Wine Fermentation and Storage Tanks*.

- Post-fermentation processing is assumed to require a maximum of 40 days of retention time based on estimates by The Wine Institute (this duration may be less at some facilities depending upon the products and operating philosophy). This retention time accounts for the tank residence time required for post-fermentation processing such as malolactic fermentation, bentonite addition, filtration(s), blending(s), tartrate stabilization, bottling/packaging or bulk shipping.
- Maximum batch size in a red wine fermenter is 80% of nominal tank capacity due to potential expansion of the fermentation mass during operation as a result of rapid evolution of CO2 from the fermentation reaction. White wine fermentation batches are assumed to be 100% of the tank's nominal capacity.

- Emission factors for wine fermentation are taken from District Rule 4694 as follows:
  - 6.2 lb-VOC/1000 gallons produced red wine
  - 2.5 lb-VOC/1000 gallons produced white wine

- Emissions from post-fermentation storage tank operations will be calculated based on 8 inter-tank transfers during post-fermentation operations. The number of inter-tank transfers is at least 8 for wine fermented on-site per information provided by the Wine Institute. Each batch of wine is moved for the following processing operations at a minimum: 1) from fermentation to storage; 2) coarse filtration, 3) special processing (ex: ion exchange, centrifugation, addition of fining agents), 4) initial blending, 5) fine filtration, 6) final blending, 7) tartrate stabilization, 8) packaging or bulk shipping. (NOTE: The processing may not occur in this order for all wineries).

- Maximum average ethanol content for wine handled in the storage tank operations is 16 volume % (based on Wine Institute estimate for a typical winery).

- The emission factor for wine storage operations is taken from District FYI-114, Estimating VOC Emissions from Wine Storage Tanks. Since all tanks are assumed to meet BACT for wine storage, it will be assumed that breathing losses from the storage tanks are negligible since, pursuant to the current District BACT guideline, the tanks must be insulated or have equivalent isolation from significant diurnal impacts. Based on this assumption, the emission factor from FYI-114 is 0.23 lb-VOC/1000 gallons of tank throughput.

- Fermentation is assumed to occur only during the crush season. Based on documentation provided by the Wine institute, the duration of both the red and white wine crush seasons in the San Joaquin Valley is potentially 120 days each.

- Generally, in the absence of other restrictions, all tanks at a facility may be used for white wine fermentation. However, in some wineries, some tanks may have been added to the facility as storage-only tanks through an NSR permitting action subsequent to the initial in-house PTO's. These would not be available for white wine fermentation and their volume must be subtracted from the total tankage capacity to determine the actual white fermenter capacity. White wine production capacity is then calculated by the following general method:

  Given total white fermenter capacity $V_w$ and the 10-day batch turnaround for white fermenters as stated above, the daily white fermenter capacity limit $W_{w1}$ (gallons per day) during crush season is:

  $$W_{w1} = V_w + 10$$
To determine the potential limitation due to storage tank capacity, the limiting daily white wine production capacity for a collection of fermentation & storage tanks with a total "effective" capacity \( V_t \) gallons may be calculated by considering a total wine residence time = 10 days fermentation + 50 days post-fermentation processing = 50 days total retention time (grape to finished wine). Where the facility does not include storage-only tanks with an NSR throughput limitation as mentioned above, the "effective" total tank capacity is equal to the total capacity of all tanks at the facility. Where the facility has NSR limited storage tanks, an effective total volume is calculated as outlined in Appendix A. The total tank production capacity for white wine \( W_{w2} \) (gallons per day) during crush season is then calculated as,

\[
W_{w2} = V_t + 50
\]

The actual facility limit for white wine production \( W_w \) is then taken as the least of either the white fermenter capacity limit \( W_{w1} \) or the total tank capacity for white wine production \( W_{w2} \)

- Since the fermentation of red wine requires specialized fermenters, the consideration of the capacity of the winery tankage to produce red wine must consider the fermentation capacity of these specialized red fermenters separately from the total processing capacity of the tanks. The smallest of either the red fermenter capacity or the total red wine processing capacity of the tanks is taken to be the red wine production limit for the facility:

Given total red fermenter capacity \( V_r \) and the 5-day batch turnaround for red fermenters as stated above, the daily red fermenter capacity limit \( W_{r1} \) (gallons per day) during crush season is:

\[
W_{r1} = V_r + 5
\]

To determine the potential limitation due to storage tank capacity, the limiting daily red wine production capacity for a collection of fermentation & storage tanks with a total "effective" capacity \( V_t \) gallons may be calculated by considering a total wine residence time = 10 days fermentation + 50 days post-fermentation processing = 50 days total retention time (grape to finished wine). Note that the total tank volume is an "effective" volume as described above for white wine. The total tank production capacity for red wine \( W_{r2} \) (gallons per day) during crush season is then calculated as,

\[
W_{r2} = V_t + 45
\]

The actual maximum daily capacity for red wine production \( W_r \) is then taken as the least of either the red fermenter capacity limit \( W_{r1} \) or the total tank capacity for red wine production \( W_{r2} \)

Calculation Model Sequence:

The Potentials to Emit for both a facility's wine fermentation operations and for the facility's storage tank operations are determined in the following sequence:

1. Potential fermentation emissions from a 100% white wine production scenario are first determined:
White wine production capacity is determined as the lesser of the production capacities of either the crushing, pressing or tankage.

\( W_W = \) White wine production capacity (gallons per year as measured immediately after pressing) and is the lesser of the following three calculations:

\[ W_1 = C \times D_w \times M \] (limited by crusher capacity)

\[ W_2 = P \times D_w \times M \] (limited by pressing capacity)

\[ W_3 = \frac{V_{FW} \times D_w}{W_{FW}} \] (limited by white fermenter volume)

\[ W_4 = \frac{V_T \times D_w}{R_{TW}} \] (limited by overall tank processing)

\( C = \) grape crushing capacity, tons/day
\( D_w = \) days in a white wine crush season = 120 days
\( M = \) gallons of grape juice produced per ton of grapes = 200 gallons/ton
\( P = \) pressing capacity, tons per day
\( W_{FW} = \) White fermentation period = 10 days
\( R_{TW} = \) Total winery retention time for white wine, 40 + 10 = 50 days
\( V_{FW} = \) total volume of white wine fermenters
\( V_T = \) Effective Total Winery Cooperage (gal) for white wine – see Appendix A

Potential white wine fermentation emissions are then determined by applying the white fermentation emission factor to the production capacity determined above:

\[ P_{E_{whitefermentation}} = E_{fw} \times W_W \]

where,

\( E_{fw} = \) white wine emission factor = 2.5 lb-VOC/1000 gal (District Rule 4694)

2. Potential fermentation emissions from a 100% red wine production scenario are then determined:

Red wine production capacity is determined as the lesser of the production capacities of either the crushing, pressing or tankage.

\( W_R = \) Red wine production capacity (gallons per year as measured immediately after pressing) and is the lesser of the following four calculations:

\[ W_1 = C \times D_r \times M \] (limited by crusher capacity)

\[ W_2 = P \times D_r \times M \] (limited by pressing capacity)

\[ W_3 = \frac{V_{FR} \times F \times D_r}{R_{FR}} \] (limited by red fermenter volume)

\[ W_4 = \frac{V_T \times D_r}{R_{TS}} \] (limited by overall tank processing)

\( C = \) grape crushing capacity, tons/day
\( D_r = \) days in a red wine crush season = 100 days
\( F = \) Fill factor for red wine fermentation = 80%
\( M = \) gallons of grape juice produced per ton of grapes = 200 gallons/ton
\( P = \) pressing capacity, tons per day
\[ R_{FR} = \text{Red fermentation period} = 5 \text{ days} \]
\[ R_{TS} = \text{Total winery retention time for red wine, } 40 + 5 = 45 \text{ days} \]
\[ V_{FR} = \text{total volume of red wine fermenters} \]
\[ V_T = \text{Effective Total Winery Cooperage (gal) for red wine – see Appendix A} \]

Potential red wine fermentation emissions are then determined by applying the red fermentation emission factor to the production capacity determined above:

\[ \text{PE}_{\text{red fermentation}} = E_{fr} \times W_R \]

where,
\[ E_{fr} = \text{red wine emission factor} = 6.2 \text{ lb-VOC/1000 gal (District Rule 4694)} \]

3. The facility’s PE for fermentation operations is then taken to be the greater of either the white or red PE’s determined above.

\[ \text{PE}_{\text{fermentation}} = \text{greater of } \text{PE}_{\text{white fermentation}} \text{ and } \text{PE}_{\text{red fermentation}} \]

4. Emissions from storage tank operations are then determined for both the red and white wine production cases by applying the factors described above.

\[ \text{PE}_{\text{whitestorage}} = E_s \times T \times W_W \]
\[ \text{PE}_{\text{redstorage}} = E_s \times T \times W_R \]

\[ E_s = \text{wine storage emission factor based on District FYI-114} = 0.230 \text{ lb-VOC/1000 gallons of wine transferred} \]
\[ T = \text{Total post fermentation inter-tank transfers per batch of wine} = 8 \]

The facility’s PE for storage tank operations is taken to be the larger of the PE’s for either red or white wine production.

\[ \text{PE}_{\text{storage}} = \text{greater of } \text{PE}_{\text{whitestorage}} \text{ and } \text{PE}_{\text{redstorage}} \]

Example:

The wine production Potentials to Emit for VOCs will be determined for a hypothetical Winery. The hypothetical winery has in-house Permits to Operate for all its wine tanks for operation as both fermenters and storage tanks except for eight (8) 60,000 gallon wine storage-only tanks (480,000 gallons total) which were permitted by an NSR action subsequent to the initial permitting. The eight storage-only tanks are limited by an SLC to a total annual throughput of 2,000,000 gallons per year with a maximum ethanol content of 14%. All fermentation and storage tanks meet Achieved-in-Practice BACT. Crushing and pressing equipment ratings are 150 and 100 tons per hour respectively.

The effective tank capacities and the wine grape processing equipment are summarized as follows:

- Effective Total Tankage Capacity = 14,625,000 and 14,614,000 gallons for white and red wine respectively = \( V_T \) (see Appendix A)
- Red Fermenter Capacity = 2,000,000 gallons = \( V_{FR} \)
- White Fermenter Capacity = total cooperage – storage only tanks = 14,520,000 gallons
• All storage tanks are insulated and equipped with PVRVs (storage tank breathing losses may be ignored).

• Crushing Capacity = 3,600 tons per day (150 tons/hour) = C

• Pressing Capacity = 2,400 tons per day (100 tons per hour) = P

1. Scenario 1 (all white):

\[ W_1 = C \times D_w \times M = 3,600 \times 120 \times 200 = 72.0 \text{ MG/yr (million gallons per year)} \]
\[ W_2 = P \times D_w \times M = 2,400 \times 120 \times 200 = 48.0 \text{ MG/yr} \]
\[ W_3 = (V_{FW} \times D_w) / W_{FW} = (14,520,000 \times 120)/10 = 174 \text{ MG/yr} \]
\[ W_4 = (V_T \times D_w) / R_{TW} = (14,625,000 \times 120)/50 = 35.1 \text{ MG/yr} \]

Taking the lesser of the four:
\[ W_W = W_2 = 35.1 \text{ MG/yr} \]

Then,
\[ PE_{whitefermentation} = E_w \times W/1,000 = 2.5 \times 35.1 \times 10^6/1000 = 87,750 \text{ lb-VOC/year} \]

2. Scenario 2 (all red)

- \[ W_1 = C \times D_r \times M = 3,600 \times 120 \times 200 = 72.0 \text{ MG/yr} \]
- \[ W_2 = P \times D_r \times M = 2,400 \times 120 \times 200 = 48.0 \text{ MG/yr} \]
- \[ W_3 = (V_{FR} \times F \times D_r) / R_{FR} = (2,000,000 \times 80\% \times 120)/5 = 38.4 \text{ MG/yr} \]
- \[ W_4 = V_T \times D_r / R_s = 14,614,000 \times 120/45 = 39.0 \text{ MG/yr} \]

Taking the lesser of the four:
\[ W_R = W_2 = 38.4 \text{ MG/yr} \]

Then,
\[ PE_{redfermentation} = E_r \times W/1,000 = 6.2 \times 38.4 \times 10^6/1000 = 238,080 \text{ lb-VOC/year} \]

3. Establish PE for fermentation

\[ PE_{fermentation} = \text{greater of } PE_{whitefermentation} \text{ and } PE_{redfermentation} \]
\[ PE_{fermentation} = 238,080 \text{ lb-VOC/year} \]

4. Calculate PE for Storage Operations

Since the calculated wine production rates have already considered the limitation introduced by the NSR limit on the storage-only tanks, no further consideration of throughput capacity is required for calculation the PE for storage operations. However, the storage-only tanks are limited to 14% ethanol for their maximum throughput of 2,000,000 gallons which requires a different emission factor. Per FYI-114, an emission factor of 0.198 lb-VOC/1000 gallons is applicable. Since the potential production of red wine is
greater than that of white as calculated above, storage throughput will be based on this production value (38.4 MG/yr) and a minimum of 8 transfers per gallon of wine:

\[
P_{E_{storage}} = E_s \times T \times W_R = \frac{0.23}{1000} \times (8 \times 38.4 - 2.0) \times 10^6 \\
+ \left( \frac{0.198}{1000} \right) \times 2.0 \times 10^6 = 70,592 \text{ lb-VOC/year}
\]
Appendix A
Calculation of Effective Tank Volume

Most wine tanks in the District have been permitted as in-house PTO’s and thus have no NSR limitations on their operation. However, subsequent to the initial permitting action, some wineries may have added storage tanks, permitted under NSR, either as Routine Replacements or as Fully Offset Units. These tanks are subject to throughput limits and thus may have an impact on the overall production capacity of the winery. To evaluate this impact within the calculation model presented in this policy, it is necessary to determine an “effective volume” which represents the total volume of the tankage at the facility and allows the calculation model to account for any limitation on production capacity resulting from the NSR limit on these additional tanks. The correction procedure is based on comparing the maximum number of annual tank turns (throughput expressed as the number of tank volumes per year) allowed for the NSR-limited tanks with the average minimum number of tank turns required to process the facility throughput based on residence time considerations only. Note that when a minimum of eight wine transfers during storage (per the calculation model) are considered for each gallon of wine produced, the minimum average number of tank turns is independent of the total capacity of the tanks and is established from the tank production capacity equation as follows:

White Wine:

\[ W_4 = \left( 8 \times \frac{V_T \times D_w}{R_{TW}} \right) + V_T = \left( 8 \times \frac{D_w}{R_{TW}} \right) = 8 \times \frac{120}{50} = 19.2 \text{ turns} \]

Red Wine:

\[ W_4 = \left( 8 \times \frac{V_T \times D_r}{R_{TR}} \right) + V_T = \left( 8 \times \frac{D_r}{R_{TR}} \right) = 8 \times \frac{120}{45} = 21.3 \text{ turns} \]

When the maximum number of turns allowed for certain NSR-permitted storage tanks is less than this average, these tanks are assumed to limit production capacity and an effective volume for these tanks, used for purposes of determining production capacity, must be determined. The actual volume of the NSR-limited tanks is adjusted by the ratio of the maximum allowed number of turns to the average minimum number of tank turns. This adjusted volume is used, in turn, to determine the effective volume of all tankage at the facility. The following example illustrates the correction:

Volume Correction Example

Using the example PE calculation presented in this policy, total tankage capacity is 15,000,000 gallons which includes 480,000 gallons of storage tanks limited to 2,000,000 gallons per year. The 2,000,000 gallon per year limitation for the NSR-limited tanks limits the number of turns for these tanks to:

\[ 2,000,000 \text{ gal/yr} + 480,000 \text{ gal/turn} = 4.2 \text{ turns} \]

The effective capacity for wine production for the NSR-limited tanks is considered to be limited to the extent that the maximum allowable number of turns is less than the minimum average number of turns required for wine production. Therefore, the effective volume for these tanks is considered to be:
\[(4.2/19.2) \times 480,000 = 105,000 \text{ gallons for white wine production}\]
\[(4.2/21.3) \times 480,000 = 94,600 \text{ gallons for red wine production}\]

Total tank capacity for the facility is then adjusted to an effective value by deducting the storage-only tanks from the total and then adding back the effective volume of the storage-only tanks, or

\[V_{\text{effective}} = 15,000,000 - 480,000 + 105,000 = 14,625,000 \text{ gallons for white wine}\]
\[V_{\text{effective}} = 15,000,000 - 480,000 + 94,600 = 14,614,000 \text{ gallons for red wine}\]

Appendix F

Daily PE1 for Storage Tank Emissions Units
Daily Pre-Project Potential to Emit for Storage Emissions Units

Basis:
- Daily emission Factor is 0.432 lb-VOC/1000 gal for 20% alcohol wine
- Daily emission Factor is 0.335 lb-VOC/1000 gal for 16% alcohol wine
- Daily emission Factor is 0.289 lb-VOC/1000 gal for 14% alcohol wine
- All tanks are insulated - hence all emissions are due to working losses
- Where no daily throughput is listed on the permit, throughput is assumed to be four times the maximum tank capacity

BACT is the most stringent control technique for the emissions unit and class of source. Control techniques that are not achieved in practice or contained in a state implementation plan must be cost effective as well as feasible. Economic analysis to demonstrate cost effectiveness is required for all determinations that are not achieved in practice or contained in an EPA approved State Implementation Plan.

*This is a Summary Page for this Class of Source - Permit Specific BACT Determinations on Next Page(s)*
Top-Down BACT Analysis for VOC Emissions from Wine Fermentation Tanks

Step 1 - Identify All Possible Control Technologies

The SJVUAPCD BACT Clearinghouse Guideline 5.4.14 identifies achieved-in-practice BACT for wine fermentation as 'Temperature-controlled open top tank with maximum average fermentation temperature of 95 deg. F'.

The following technologically feasible controls are identified in the BACT Guideline:

1. Capture of VOCs and Thermal Oxidation or Equivalent
2. Capture of VOCs and carbon adsorption or equivalent
3. Capture of VOCs and absorption or equivalent
4. Capture of VOCs and condensation or equivalent

There are no controls identified under the Alternate Basic Equipment category.

Step 2 - Eliminate Technologically Infeasible Options

All of the options listed above are considered to be technologically feasible.

Step 3 - Rank Remaining Control Technologies by Control Effectiveness

The options enumerated above can be ranked as follows:

<table>
<thead>
<tr>
<th>Rank</th>
<th>Option</th>
<th>Control</th>
<th>Overall Capture &amp; Control Efficiency(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

<td>-</td>
</tr>
</tbody>
</table>

(*) Capture efficiency (90%) x removal efficiency for control device
(**) Following recent District practice, thermal and catalytic oxidation will be ranked together.
Step 4 - Cost Effectiveness Analysis

General Approch for Cost Effectiveness Analysis

Due to differences in processing temperature, red wine has an emissions factor of 6.2-lb VOC/1,000 gallons whereas white wine has an emissions factor of 2.5-lb/1000 gallons of fermented wine. In addition, red wine fermentation batches are completed in 3 to 5 days versus 10 to 14 days for white wine fermentation. Therefore, a red wine fermentation tank of a given size will potentially operate at significantly higher throughput and produce significantly higher emissions per unit of throughput relative to a white wine fermentation tank of the same size. As a result of these differences in emission rates, the cost effectiveness for controlling emissions from red wine will be fundamentally better than that for white wine and thus the cost effectiveness analysis will be first performed for red wine only. In the event a technology is shown to be cost effective for red wine, that particular technology will be analyzed for white wine fermentation as well.

The following emission control technologies have been determined to be technologically feasible for control of VOC emissions from wine fermentation tanks:

- Thermal Oxidation (88% control)
- Carbon Adsorption (86% control)
- Refrigerated Condenser (81% control)
- Wet Scrubber (81% control)

Recognizing that “thermal oxidation” includes both recuperative and regenerative thermal oxidizers, the cost effectiveness of the following cases will be examined:

Case 1  Thermal oxidation with 0% heat recovery (low capital/high operating cost)
Case 2  Regenerative thermal oxidation with 95% heat recovery (high capital/low operating cost)
Case 3  Refrigerated Condensers
Case 4  Water scrubber
Case 5  Carbon adsorption

To establish a comparative physical scope of each of the above cases, the District took an industry-wide approach based on applying the five different control technology cases to red wine fermentation tanks located at the E & J Gallo Winery at Livingston, California. The rationale for this is based on the following:

- The Gallo facility at Livingston is sufficiently representative of typical red wine fermentation facilities located at major source wineries to allow it to serve as a general model for the physical scope requirements of such facilities including the O’Neill facility.
- The Gallo facility is currently the largest winery in the world, with average fermentation tank sizes larger than those used by smaller wineries. Any control technology found to not be cost effective for the Gallo facility can be assumed to be not cost effective to smaller
facilities due to economies of scale. If any technology is determined to be cost effective at Gallo, it will then be analyzed for other smaller facilities on a case-by-case basis to confirm cost effectiveness for the smaller operation.

- The Gallo facility was used as a basis for engineering and cost effectiveness studies in development of District Rule 4694 and substantial scope and cost information is available for this facility pertaining to the scope of control system requirements and that of the ancillary systems required to support the basic emission control units (such as ductwork and supports and the CIP systems for the ductwork). The Eichleay study details the potential application of VOC controls to this facility and addresses many of the technical issues and the general site specific factors for wineries. This study developed two separate estimates, one for the fermentation control system installation ("Base Estimate") and a second "Utilities Estimate" to cover the clean-in-place system, the expansion of the plant electric utility and the instrument air system. District staff has reviewed the estimating methodology employed in the Eichleay estimates and found that the estimating approach is fundamentally sound and follows accepted practice in the engineering and construction industry, applying reasonable unit rates and costs for materials and labor for development of direct costs. This information is available to use as a basis for this cost effectiveness analysis. The Eichleay Base and Utilities Estimates are attached as BACT Attachment A.

**Estimating Basis**

Estimates of Total Capital Investment (TCI), annual costs, potential emission reductions, and the resulting cost effectiveness have been prepared for each of the control technology cases above utilizing selected portions of the Direct Costs developed by the Eichleay study. The general approach and basis of the estimates is as follows:

1. Except for specific substitutions or modifications as listed below, EPA's cost template for VOC incineration systems, as presented in the EPA Control Cost Manual, Section 3.2, Tables 2.8 and 2.9, was used. Typical site specific factors and other required direct costs not covered by the template have been extracted from the Eichleay study and inserted in the template to cover all the scope elements required for installation of controls on fermentation tanks. To ensure that all estimate cases are comparative, the EPA cost template (with EPA cost factors) was used to develop the direct cost of installing the purchased control device for all estimate cases. The control device is taken to include the upstream separator vessel which is used to separate any entrained liquids from the fermentation tank vent stream before it enters the control device.

2. All estimates are based on the general facilities design prepared by Eichleay for the Gallo winery at Livingston, CA. Using this basis, the impact of substituting different control technologies will be examined. It is assumed that the basic scope of ductwork and supports, tank modifications, ancillary systems and site specific costs will be common to all technologies.

3. The Gallo facility consists of 60 red wine fermentation tanks with a combined nominal capacity of 6,850,000 gallons. In the general facilities design as prepared by Eichleay the tanks are grouped into four separate groups of tanks, each group separately manifolded together and ducted to a separate dedicated control device. The tank groupings are designated as follows:
VOC-1  Seventeen (17) 100,000 gallon tanks
VOC-2  Twelve (12) 200,000 gallon tanks
VOC-3  Ten (10) 100,000 gallon tanks and seven (7) 50,000 gallon tanks
VOC-4  Fourteen (14) 100,000 gallon tanks

4. Control device capacity (per the Eichleay study) is based on a peak vapor rate of 9.75 scfm/1000 gallons of wine fermenting at an 85 °F fermentation temperature. Since the Eichleay study was based solely on using a thermal incinerator as the control device, an additional 23.6 % flow capacity is included in the control device capacity to account for the combustion air which must be added since the vent stream from the tank contains only CO2, water and ethanol. Other non-combustion control technologies do no require additional air and may thus be rated at a lower flow capacity. On this basis, the four control devices have been determined to require the following capacities:

<table>
<thead>
<tr>
<th>VOC Device Number</th>
<th>No. of Tanks</th>
<th>Fermentation Tank Capacity (gallons)</th>
<th>Total Capacity of Red Fermentation Tanks (gallons)</th>
<th>Combustion Control Device Flow Capacity per the Eichleay Study (SCFM)</th>
<th>Non-Combustion Control Device Flow Capacity (SCFM)</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

5. Capacities and costs for control devices for each case were developed based on the capacities of the four VOC systems listed above. Sources for pricing of control devices were as follows:

Recuperative Thermal Oxidizers: EPA Cost Control Manual, Section 3.2, Chapter 2, Equation 2.29

Regenerative Thermal Oxidizers: Vendor quotations obtained by Eichleay Engineering

Carbon Adsorption System: Technical Assessment Document, p.17
Water Scrubbers: STI Study\(^1\), Table 5

BACT Attachment B presents the developed capacities and estimated purchase prices for the control devices for each estimate case.

6. Purchased equipment costs for the knock out vessels (common to all estimate cases) have been extracted from the main Eichleay estimate. A purchased material cost of $148,000 for the knock out vessels was taken from page 15 of Eichleay's main estimate. Sizing criteria is presented in the Eichleay study and the pricing was developed based on Eichleay's in-house estimating data for this type of equipment derived from purchasing experience on previous projects.

7. Direct costs taken from the Eichleay study will be used for estimation of site specific and other costs not covered by the equipment factors in the EPA VOC incineration cost template. These costs include site preparation, ductwork, structural steel pipeway and associated foundations for ductwork support, clean-in-place (CIP) system, expansion of the plant electric utility, modification of fermentation tanks for duct connections, and the instrumentation system for control of tank foam over.

8. Site preparation costs to develop a plot area for the VOC control equipment have been extracted from page 4 of the main Eichleay estimate which the District considers to be typical of the requirements which would be encountered at most existing major wineries. Most wineries are constructed with the tanks located in tight groups with minimal spacing between the tanks, requiring that control devices be installed on the perimeter of the winery, typically undeveloped agricultural land. Extracted costs from the Eichleay include subcontract pricing for demolition of an existing road, installation and compaction of fill, and new pavement to develop a plot space sufficient to install four new control devices with upstream separators and associated piping and ducting. These costs total $1,254,000 and are based on budgetary subcontract pricing obtained by Eichleay.

9. The total direct cost for ductwork was extracted from the Eichleay study. A material cost of $1,104,800 and an installation labor cost of $940,500 for the ductwork has been extracted from pages 16 through 23 of the main Eichleay estimate. California sales tax of 8% and freight charges of 3% were added to the materials cost to arrive at a direct cost of $2,167,000 for the ductwork. Estimated ductwork quantities are based on Eichleay plan drawings and process flow diagrams. Unit costs for fabricated stainless steel ductwork were based on a budgetary quotation obtained by Eichleay from Viron International, a ductwork spool fabricator.

10. A material cost of $1,779,600 and an installation labor cost of $752,000 for structural steel to support the new ductwork system and associated piping has been extracted from the totals presented on page 8 of the Eichleay base estimate. California sales tax of 8% and freight charges of 3% were added to the materials cost to arrive at a direct cost of $2,727,000 for the structural steel. Steel design and quantities in this estimate are based on Eichleay plan drawings. Fabricated steel pricing was based on a quotation obtained by Eichleay from a structural steel fabricator in Bakersfield, CA.

11. Costs for heavy lift equipment including heavy cranes and use of a helicopter operation to set steel structures and ductwork was taken from page 24 of the main Eichleay estimate. Pricing was obtained by Eichleay from a helicopter firm based out of the Fresno Airport.

12. The Eichleay utility estimate developed a total direct cost of $5,859,000 for both the CIP system and the expansion of the plant electric utility. Eichleay drawing SK-30892-004 provides a piping and instrumentation diagram for the CIP chemicals storage and supply system. Drawing SK-30892-006 illustrates the CIP spray header installation in the ductwork. Expansion of the electric utility included new 12 kV switchgear and 1500 kVA transformer to supply power from the existing switchyard to the project (see Eichleay drawings 30892-SK-E01 and E02). A direct allocated cost of $314,000 for the electric utility expansion was extracted from page 8 of the utilities estimate. Total Direct Cost for this item is taken as 391,000 after pro-rating the Contractor's Fee and other unallocated construction expense from the estimate. The balance of the Total Direct Cost (labeled "Field Cost" in the estimate summary sheet) is the direct cost of $5,468,000 for the CIP system (this figure includes a small amount for expansion of the plant instrument air system also).

13. The direct costs (materials, labor, and subcontracts) to modify the fermentation tanks for installation of new nozzles required for connection of ductwork includes costs for build and teardown of scaffolding in each tank, demolition of existing insulation, machine cutting of each tank, fabrication and installation of new nozzles, and post-weld passivation of the tank. These costs are taken from pages 15 and 16 of the main estimate and total $487,000.

14. The direct cost for an instrumentation system for control of tank foam over was taken from page 13 of the main Eichleay estimate. The materials cost of $514,800 for capacitance probes, actuated butterfly valves and switches to be installed on each tank was adjusted to include California sales tax and a 3% freight cost. Installation labor of $57,600 from page 13 was added to yield a total direct cost for this item of $629,000. Design basis for the system is presented in the Eichleay drawings. Unit material costs are based on budgetary vendor's pricing obtained by Eichleay. Unit labor factors and costs are based on Eichleay's in-house estimating data.

15. The EPA model cost factor for foundations and supports is 8% of purchased equipment cost which in this case is applicable to only the control device and the knock out vessel. It thus does not factor in the costs of foundations for the substantial steel structures required for this project. Therefore, this cost was extracted from the Eichleay study and added as a direct cost in the estimate. Foundation design for the pipeway consists of drilled concrete piers for support of pipeway structures which require a minimal footprint relative to conventional footers and for this reason are the standard approach for support under new steel columns when they are being installed in congested areas in existing industrial facilities. Direct costs (material + labor + subcontract) for concrete pier foundations have been extracted from page 5 of the estimate ($247,000) which covers drilling, rebar fabrication and setting, forming, pouring and finishing of the drilled piers. Estimated quantities are based on Eichleay plan drawing SK-30913-001 and the steel structure sections presented in Eichleay drawing SK-S12. The unit costs were based on Eichleay's historical experience with subcontract pricing for these items.

16. Construction Expense and Contractor's Fee have been included in the direct costs at 8% and 10 percent of all other direct costs respectively. These percentages reflect those used
in the Eichleay study and are typical based on District Staff's experience. For comparison, Peters & Timmerhaus\(^2\) recommend 10% and 7% for the items respectively.

17. Annual natural gas usage of 67,412 therms was estimated for the Gallo Livingston design by Eichleay (Appendix G of the Eichleay study) based on a 12 week season and 95% thermally efficient RTO's operating 50% of the time with an ethanol concentration of 6,034 ppm for 50% of the time and in hot standby the other 50% with allowance for startups. This natural gas usage will be used as the basis for the cost effectiveness calculations, factored as required for the thermal efficiency basis of the proposed control unit.

18. Long term natural gas price is assumed to be $8.00 per MMBtu

19. Power consumption for the Gallo facility is estimated by Eichleay at 586 kW (Appendix G of the Eichleay study). Since essentially all this power is consumed by the induced draft fans at the VOC control unit, this power basis will be assumed to be the same for the induced draft fans associated with all control technologies, factored down as required for control units not requiring combustion air.

20. Power consumption will be based on a 120 day crush season and a power cost of $0.11/kWh.

21. BACT Attachment C presents a tabulation of the utilities and other annual costs for each estimate case as well as the details of the basis and calculations.

22. Escalation has been applied at a rate of 3% per year where applicable.

23. Engineering cost and construction management costs have been included at 15% and 3% of the Total Direct Cost based on the percentages applied in the Eichleay Study. These percentages reflect those used in the Eichleay study and are typical based on District Staff’s experience. A value of 15% for engineering is generally less than that recommended by Peters & Timmerhaus\(^3\) who indicate engineering costs typically are in the range of 4-21% of Total Capital Investment with a median value of 13%.

24. Calculated VOC emission reductions will be debited for collateral NOx and VOC production from firing of natural gas where applicable based on 1 lb NOX = 1 lb VOC. For natural gas, emissions are based on 0.1 lb-NOx/MBBtu and 0.0055 lb-VOC/MBBtu per AP-42. Calculated emissions from natural gas firing are presented in the following table:

<table>
<thead>
<tr>

<td>134,820</td>
<td>6,741</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

25. Contingency has been included at 10% of the sum of Total Direct Cost and Total Indirect Cost. This value is given as typically 8-20% with an average of 10% by Peters and Timmerhaus.\(^4\)

26. Operating labor requirement was estimated one full time operator for all four VOC control systems with 3 shifts per day for the duration of the 120 day crush operation.

27. Maintenance labor requirement was estimated at 80 hours per week for all four control systems during a total of 20 weeks per year.

28. Operating and maintenance labor cost was included at $19.50/hour and $33.00 for year 2005 respectively per the Eichleay study and escalated at 4% to 2009.

29. Maintenance materials have been estimated at 3% of TCI. (Peters and Timmerhaus give a typical value of 6% for general process industries).

30. Total Capital Investment has been annualized based on a 10 year equipment life and a 10% opportunity cost for capital (CRF = 0.163).

31. Calculation of potential emissions from fermentation is based upon the red wine emission factor of 6.2 lb-ethanol per 1000 gallons of red wine and upon the maximum potential wine production capacity for the fermentation tanks. Maximum annual throughput capacity is calculated as follows:

Red crush season duration of 120 days

Five day batch processing period for red wine fermentation; maximum number of batches per season = 120 days/season ÷ 5 days/batch = 24 batches per season

Total red wine fermenter volume in this estimate = 6,850,000 gallons

Maximum fill for red wine fermenter (due to foaming/expansion) = 80%

Maximum wine production capacity = working capacity of fermenters x # batches per season = 6,850,000 x 80% x 24 = 131,520,000 gallons per year

VOC Emissions = 131,520,000 gallons/year x 6.2 lb-VOC/1000 gallons

= 815,400 lb-VOC/year = 407.7 tons-VOC/year

Cost Effectiveness Estimates

Table 1 presents the development of Total Capital Investment (TCI) for all capture and control cases based on the general facilities design prepared by Eichleay (including site specific costs and CIP) and Table 2 presents the associated annual costs, emission reductions, and cost effectiveness for each capture and control case.

</table>
Step 5 – Select BACT

The lowest evaluated cost effectiveness of $18,500 per ton exceeds the District's cost effectiveness threshold of $17,500 per ton for VOC. Therefore, none of the technologically feasible controls is cost effective, and BACT is satisfied with the achieved in practice option: Temperature-controlled open top tank with maximum average fermentation temperature of 95 deg. F.

### Condenser Duty Calculation:

**Condenser Duty Basis:**

- Inlet vapor stream contains a maximum of 16,000 ppmv ethanol at 86°F
- Condensing Temperature is -12°F, 90% of Ethanol Condensed

**Latent Heat Ethanol:** 369 Btu/lb

**Vapor Heat Capacity:** 0.21 Btu/lb

**Latent Heat Water:** 1060 Btu/lb

BACT Attachment C

Utilities and Other Annual Costs
Costs for Utilities and Other Annual Operating Expenses

Costs for utilities and other annual costs are summarized in the tables on the following two pages. The basis and calculation of the costs is presented below:

**Natural Gas – applicable to Cases 1, 2 and 5 only**

**Case 1: Thermal Oxidizer with no heat recovery**

The estimate is based on the Eichleay Study which estimated the annual fuel consumption for 95% thermally efficient oxidizers at 67,412 therms/year = 6,741 MMBtu/year. At a natural gas cost of $8.00/MMBtu, the annual cost is 6,714 x $8.00 = $53,900 per year for all four regenerative thermal oxidizers with 95% heat recovery. Dividing by (1-95%) yields the fuel cost for a unit with zero heat recovery:

Case 1 Fuel Cost = $53900/(1-95%) = $1,078,000 per year

**Case 2: Regenerative Thermal Oxidizers**

Case 2 is the Eichleay Study case. Therefore,

Case 2 Fuel Cost = $53,900 per year

**Case 5 – Carbon Adsorption**

As calculated else where in this document, the carbon adsorption system will adsorb 350.62 tons per year of VOC’s. Per the TAD, 11,800 lb of steam is required to recover 1 ton of ethanol. Given a boiler fuel requirement of 1,350 Btu/lb (based on absorbed boiler duty of 1,080 Btu/lb to produce 100 psig steam from 60 F water and an 80% combustion efficiency), annual fuel consumption for recovery of 350.62 tons ethanol per year is $11,800 x 350.62 x 1,350/10^6 = 5,585 MMBtu/year.

Case 5 Fuel Cost = 5,585 MMBtu/year x $8.00/MMBtu = $44,700 per year

**Electric Power**

**Cases 1 and 2 – Thermal Oxidizers**

For these cases, power consumption is considered to be only that for the ID fans. Per the Eichleay study, annual power consumption for the ID fans associated with the thermal oxidizers is 586 kw per hour for the 120 day crush season. Annual cost at a unit power cost of $0.11/kwh is therefore

586 x 120 x 24 x $0.11 = $185,600 per year
Cases 4 and 5 – Carbon Adsorption and Water Scrubber

As in cases 1 an 2 above, only the ID fan power will be considered for these cases. However, these cases do not have to handle the extra 23.6% combustion air. Therefore, the electric power cost for the thermal oxidizer case will be divided by 1.236 to reflect lower flow rates. On this basis, Cases 3, 4 and 5 have an annual power cost of

$185,600/1.236 = $150,200 per year (for cases 4 and 5)

Case 3 – Refrigerated Condenser

Electric power for this case includes the same ID fan power consumption as Cases 4 and 5 and also requires power for operation of the refrigeration unit. This case requires 1,306 tons of refrigeration for the design case and a utilization factor of 60% will be assumed. Additionally, a coefficient of performance of 3.5 will be assumed for the equipment. Power demand for a 120 day operating season is thus:

60% x 1,306/3.5 x 12,000 Btu/ton x 1 kW/3,413 Btu x 120 days x 24 hr/day
= 2,267,000 kWh/year

At $0.11/kWh, the cost for the refrigeration power is $249,400. Adding $150,200 for ID fan power (calculated above), total power cost for this case is $399,600 per year.

Water Disposal Cost – applicable to Case 4 and 5 only

Case 4 – Water Scrubber

Water disposal requirements and costs for Case 4 (water scrubber) are taken from the STI Study:

- Water Disposal Required: 6 gpm for each 5000 scfm air flow for 90 day crush season.

- Disposal Cost: $0.25/gallon

Total airflow for all four systems, corrected to subtract the combustion air, is
(16,000 + 22,000 + 13,000 + 13,000)/1.236 = 51,800 scfm

Wastewater Rate = 51,800 scfm x 6 gpm/5,000 scf = 62 gpm

Annual wastewater generation = 62 gpm x 90 days x 1,440 minutes/day
= 8,035,000 gallons per year

Annual water disposal cost = 8,035,000 gallons x $0.25/gallon =$ 2,008,800/yr
Case 5 - Carbon Adsorption

Wastewater is generated from the regeneration of the carbon bed. Per the TAD, 11,800 lb steam is required to recover 1 ton of ethanol. Given liquid densities of 8.34 and 6.61 lb/gallon for water and ethanol respectively, the amount of wastewater produced per ton of ethanol recovered is $(11,800/8.34) + (2,000/6.61) = 1,718$ gal/ton ethanol.

As calculated in this BACT analysis, the carbon adsorption unit will adsorb 350.62 tons per year of VOC's. Produced wastewater is therefore $350.62 \times 1,718$ gal/ton = 602,400 gallons per year.

Disposal cost at $0.25/gal is $602,400 \times 0.25 = $150,600$ per year.

Carbon Replacement Cost - applicable to Case 5 only

Per the TAD, activated carbon adsorbs 18% of its weight in ethanol. However, with regeneration, approximately 1/3 of the ethanol initially adsorbed stays on the carbon bed. In addition, due to the seasonal operation of a winery, the carbon is expected to have a lifetime of 10 years.

As calculated in this BACT analysis, the carbon adsorption unit will adsorb 350.62 tons per year of VOC's. Assuming this occurs over a 120 day crush season with three regenerations per day, the amount adsorbed per cycle is $350.62/(120 \times 3) = 0.97$ tons/cycle = 1,940 lb-VOC/cycle. Assuming a daily regeneration cycle and allowing for a dual bed for regeneration purposes, the amount of carbon required for the facility is $2 \times 1,940/(18\% \times .667) = 32,300$ lb carbon.

Given a cost of $2/lb for carbon and annualizing the cost over the 10 year life, Carbon Replacement Cost = $0.163 \times 2.00 \times 32,300 = $10,500$ per year.

Cooling Water Cost – applicable to Case 5 only (carbon adsorption)

Based on values presented in the TAD, the following parameters apply:

Cooling water consumption = 82,600 gallons of cooling water per ton of VOC adsorbed

Cooling Water Unit Cost = $0.53 per 1000 gallons

Given 350.62 tons of VOC adsorbed per year, annual cost for cooling water is $82,600 \times 350.62 \times 0.53/1000 = $15,800$ per year.

**Tanks made of heat-conducting materials such as stainless steel may be insulated or stored indoors (in a completely enclosed building, except for vents, doors and other essential openings) to limit exposure of diurnal temperature variations. Tanks made entirely of non-conducting materials such as concrete and wood (except for fittings) are considered self-insulating.

BACT is the most stringent control technique for the emissions unit and class of source. Control techniques that are not achieved in practice or contained in a state implementation plan must be cost effective as well as feasible. Economic analysis to demonstrate cost effectiveness is required for all determinations that are not achieved in practice or contained in an EPA approved State Implementation Plan.

*This is a Summary Page for this Class of Source - Permit Specific BACT Determinations on Next Page(s)
Top-Down BACT Analysis for VOC Emissions from Wine Storage Tanks

Step 1 - Identify All Possible Control Technologies

The SJVUAPCD BACT Clearinghouse Guideline 5.4.13 identifies achieved-in-practice BACT for wine fermentation as ‘Insulation or Equivalent, Pressure Vacuum Relief Valve (PVRV) set within 10% of the maximum working pressure of the tank; “gas-tight” tank operation; and continuous storage temperature not exceeding 75 degrees F, achieved within 60 days of completion of fermentation’.

The following technologically feasible controls are identified in the BACT Guideline:

1. Capture of VOCs and thermal or catalytic oxidation
2. Capture of VOCs and carbon adsorption or equivalent
3. Capture of VOCs and absorption or equivalent
4. Capture of VOCs and condensation or equivalent

There are no controls identified under the Alternate Basic Equipment category.

Step 2 - Eliminate Technologically Infeasible Options

All of the options listed above are considered to be technologically feasible.

Step 3 - Rank Remaining Control Technologies by Control Effectiveness

The options enumerated above can be ranked as follows:

<table>
<thead>
<tr>
<th>Rank</th>

<td></td>
<td>Achieved in practice BACT</td>
<td>-</td>
</tr>
</tbody>
</table>

(*) Capture efficiency (90%) x removal efficiency for control device
(**) Following recent District practice, thermal and catalytic oxidation will be ranked together.
Step 4 - Cost Effectiveness Analysis

A cost effectiveness analysis is performed for each control technology which is more effective than achieved-in-practice BACT. The cost-effectiveness analysis will be performed based on the following:

- Since the most cost effective approach will be achieved by installing a common control device for multiple tanks, the analysis will be based on this approach.

- To expand the scope and generality of this BACT, the cost-effectiveness analysis will be based on a hypothetical "industry-typical" storage tank operation consisting of a battery of twelve (12) storage tanks each with a capacity of 200,000 gallons. Total annual throughput for the hypothetical tank battery is 39.6 million gallons per year based on an individual annual throughput of 3,300,000 gallons per year each (equivalent to almost 17 turns per year of each storage tank versus an estimated industry average of 6 turns per tank\(^1\)). Total throughput subject to VOC control by a common VOC control device is thus 39.6 MMgal/year. Based on economies of scale, it is obvious that any control found not to be cost-effective at this level of throughput would be even less cost-effective at lower capacities.

Industry Standard

During the development of District Rule 4694, it was determined that use of pressure/vacuum valves and some level of refrigeration on wine storage tanks is a standard operation for large wineries in the San Joaquin Valley. Additionally, essentially all storage tanks are insulated. This was directly confirmed with four large wineries: Mission Bell (Madera), Gallo-Livingston, Bronco, and Robert Mondavi. Based on this, the wine storage tank VOC control requirements of District Rule 4694 and tank insulation are also determined to be "industry standard".

Although exempt from the rule requirements, concrete and wood tanks also conform to these industry standards. Since concrete and wood are materials of poor heat conductivity, they are considered self-insulating and therefore usually do not need added insulation as is the case with steel tanks.

The emission factor for "industry standard" operation is determined based on Table 1 of the District's FYI-114, Estimating Emissions from Wine Storage Tanks (BACT Attachment A), for an insulated storage tank with up to 20% ethanol content in the wine being stored:

\[ E_f \text{ (industry standard)} = 0.297 \text{ lb-VOC/1000 gal of wine throughput} \]

Uncontrolled emissions for Twelve-Tank Battery

Uncontrolled Emissions = Gallons Throughput/year x 0.297 lb-VOC/1000 gallons
= (39.6 x 10^6 gal/year) x (0.297 lb-VOC/1000 gal)

Uncontrolled Emissions = 11,761 lb/year

\(^1\) Per discussions with the Wine Institute (Bob Calvin of Constellation Wines) during Rule 4694 development (8/16/05)
Capture of VOCs with Thermal or Catalytic Oxidation/ Carbon Adsorption/Absorption or Condensation (Options 3, 4, 5 and 6)

A common feature of all of these options is that they require installation of a collection system for delivering the VOCs from the tanks to the common control device. The analysis below indicates that these options are not cost effective by showing that just the annualized direct cost for the ductwork of the collection system and supporting structural steel and foundations alone is too large, when considered at the District’s cost effectiveness threshold for VOC BACT, to justify the capital investment required by these options. This approach ignores additional major costs for the actual control device and its installation and for equipment sterilization systems for ductwork and control device, instrumentation and control systems for isolation of individual tanks in the battery, site specific factors due to limited plot space (known to be a significant factor at all wineries), and operating and maintenance costs for each system. Should all these additional cost factors be included, the calculated cost effectiveness would be substantially higher than indicated below.

a. Control Efficiency

Option 4 is capable of a 98% reduction in VOC emissions while the remaining options under consideration have lesser control efficiencies. Showing that all of the options under consideration are not cost effective at a 98% reduction level based on capital investment requirements of ductwork and steel alone is adequate since options other than thermal/catalytic oxidation would be even less cost effective at their actual (lower) reduction levels.

Annual Emission Reduction = Uncontrolled Emissions x 0.98
= 11,761 lb-VOC/year x 0.98
= 11,526 lb-VOC/year
= 5.76 tons-VOC/year

b. Capital Investment For Installation of a VOC Collection System

Design and Estimate Basis:

- The collection system consists of stainless steel plate ductwork (stainless steel is required due to food grade product status) with isolation valving, connecting twelve 200,000 gallon tanks to a common manifold system which ducts the combined vent to the common control device. The cost of dampers and isolation valving, installed in the ductwork, will not be included in the cost estimate.

- A minimum duct size is established at 6 inches diameter at each tank to ensure minimal backpressure of the tank during filling operations and to provide adequate strength for spanning between supports. The main header is 12" diameter to handle the potential for simultaneously venting all tanks based on a potential fill rate of 1,000 gpm for each tank (per industry) and a duct velocity of 2,000 feet per minute.

- The ductwork is designed with features to facilitate clean-in-place (CIP) operation to allow for periodic sterilization procedures as required for food grade products. The CIP
system includes strategically placed spray nozzles on the ductwork for injecting sterilizing solutions into the system. Cost impacts to install CIP systems to clean the ducting are not included in the cost estimate.

- The ductwork is supported on a structural steel piperack mounted on drilled concrete piers, running through the tank battery. Ducting elevations are established to allow continuous free draining to the separator located at the control device.

- Unit Installed Costs for Ductwork: A direct cost estimate for 12\" diameter stainless steel ductwork, installed in a San Joaquin Valley winery, was taken from a study prepared by Eichleay Engineering for the Wine Institute in conjunction with development of District Rule 4694\(^2\). The estimate is based on 2nd quarter 2005 dollars, and includes fittings, miscellaneous duct supports and other materials plus field labor costs required to install the ductwork, but does not include other associated indirect costs such as construction management, engineering, owner's cost, contingency, etc. BACT Attachment B presents the development of unit installed costs for stainless steel ducting based on the costs derived from the Eichleay estimate.

- Linear feet of ducting required was extracted from the Eichleay Estimate for a similar system at Gallo-Livingston (see BACT Attachment B).

- Costs for structural steel supports and foundations were extracted from the Eichleay Estimate for a similar system at Gallo-Livingston (see BACT Attachment B).

- Sales tax of 8\% was applied to all materials.

- Indirect costs include Engineering, Construction Expense and Contractor's Fee and Contingency. Factors for these costs are taken from Peters & Timmerhaus\(^3\).

**Capital Investment (for ductwork and steel supports)**

Fixed Capital Investment is summarized in the following table:

---

\(^2\) Eichley Engineers of California, *Fermenter VOC Emissions Control Cost Estimate Revision 1*, Eichley Project Numbers 30892 and 30913, June 30, 2005

<td></td>
<td>$830,759</td>
</tr>
</tbody>
</table>
Annualized Capital Investment and Cost Effectiveness (based on ductwork):

Annualized Capital Investment = Initial Capital Investment x Amortization Factor
Amortization Factor = 0.163 per District policy, amortizing over 10 years at 10%
Therefore,

Annualized Capital Investment = $830,759 x 0.163 = $135,414
Cost Effectiveness = Annualized Cost/Annual Emission Reductions

Cost Effectiveness = $135,414/5.76 tons-VOC = $23,509/ton-VOC

As shown above, the cost of VOC reduction by capture of VOCs with thermal or catalytic oxidation, carbon adsorption, absorption or condensation would be greater than the $17,500/ton cost effectiveness threshold for VOC in the District BACT policy, based only on the direct cost required for the collection ducting. Therefore these options are not cost-effective and will not be considered for this project.

Step 5 - Select BACT

All identified feasible options with control efficiencies higher than the option proposed by the facility have been shown to not be cost effective. The facility has proposed Option 1, Insulation or Equivalent, Pressure Vacuum Relief Valve (PVRV) set within 10% of the maximum allowable working pressure of the tank; "gas-tight" tank operation; and continuous storage temperature not exceeding 75 °F, achieved within 60 days of completion of fermentation. These BACT requirements will be placed on the ATCs as enforceable conditions.

BACT Attachment B

Development of Direct Costs for Installation of a VOC Collection System on a Battery of Wine Storage Tanks
Background

During the development of District Rule 4694 (Wine Fermentation and Storage Tanks), The Wine Institute commissioned a study by Eichleay Engineers of California to develop costs for installation of VOC controls on all wine fermentation tanks at the Gallo winery located in Livingston, CA. The SJVAPCD participated in development of the study and in the review of the final draft. The District reviewed this estimate (Eichleay study) in conjunction with the development of District Rule 4694 (see Appendix C, Final Draft Staff Report - Rule 4694, December 15, 2005). The District’s review indicated that, although the District took issue with various scope elements of the overall estimate, the estimating methodology employed appears to be fundamentally sound and follows accepted practice in the engineering and construction industry, accurately estimating the material quantities required for the stated scope and applying reasonable unit rates and costs for materials and labor for development of direct costs.

The Eichleay study developed detailed direct cost estimates for four separate tank batteries at Gallo-Livingston; VOC-1, ‘-2, ‘-3 and ‘-4 (see plot diagram in Attachment A). The direct cost estimate scope for each battery included a stainless steel ducting manifold system connected to a VOC control device and structural steel ducting supports with associated foundations. VOC-2 is a tank battery consisting of twelve (12) 200,000 gallon capacity tanks, identical to the hypothetical “industry-typical” tank battery installation which forms the basis for the cost effectiveness calculations for this BACT determination. The estimates of ducting, steel supports and foundations prepared in the Eichleay study for VOC-2 can be used as a basis to establish costs for the cost effectiveness evaluation required by this BACT determination.

Approach and Estimate Basis

Ducting

Attachment B is the detailed direct cost estimate from the Eichleay study for ducting for VOC-2 (annotated to indicate the required subtotals). Since VOC-2 at Gallo-Livingston consists of twelve fermentation tanks rather than storage tanks, the diameter of the estimated ductwork is larger than required for storage-only tanks due to the much larger vent rate from fermentation. However, since the tank sizes and layout considerations would not be affected by tank utilization, the Eichleay estimate of total linear footage and duct fittings ductwork can be utilized directly. The estimate details in Attachment B are utilized in the following manner to develop ducting costs for the “industry typical” tank battery:

- Linear feet of ductwork required is taken directly from the Eichleay estimate for VOC-2 (Attachment B). Linear feet required for individual branch connections to each tank is given by the footage of 12" diameter ducting while the linear footage for the main header is represented by the balance of the ductwork for VOC-2. Based on this approach, 75 linear feet of ducting is required for branch connections to the tanks while 870 feet of ducting is required for the main headers and the ducting run to the control device. Since the “industry-typical” ducting for storage tanks has been determined to be 6" diameter for branch connections and 12" diameter for the main header, the following material requirements are established for the “industry-typical” storage tank battery:
6" diameter ducting: 75 linear feet
12" diameter ducting: 870 linear feet

- Unit direct cost (\$ per foot) of 12" diameter ducting can be determined by adding the labor and material costs required and dividing by the total linear footage of the particular diameter of ducting included in the estimate. For the 75 linear feet of 12" diameter ducting included in the Eichleay estimate for VOC-2, total labor and material costs were estimated at $5,137 and $5,650 respectively. Dividing each figure by 75 yields the unit labor and material costs for 12" diameter ducting:

  Unit labor cost for 12" ducting: \$68.49/ft
  Unit material cost for 12" ducting: \$75.33/ft

- The Eichleay estimate did not include estimates of direct cost for 6" diameter duct. Therefore, it is necessary to develop a cost by appropriate factoring of the 12" diameter cost. To adjust the direct cost to a 6" system, cost equations for stainless steel plate ductwork are taken from the EPA Air Pollution Control Manual, Section 2, Chapter 1, Table 1.9, which indicates a cost equation for stainless steel plate duct as follows:

  \[ \text{Duct Cost} = 6.29 \times (\text{Duct Diameter}_{\text{inches}})^{1.23} \]

  Using this equation form, it is apparent that the relative cost of 6" duct versus 12" duct can be calculated as follows:

  \[ 6" \text{ Duct Cost} = 12" \text{ Duct Cost} \times (6/12)^{1.23} \]

  Since the EPA cost manual develops total direct cost based on applying additional factors to the duct cost, the use of the above factor for adjustment of the total direct cost is consistent with EPA cost estimation methods.

  Therefore,

  Unit Labor Cost for 6" Duct = \$68.49 \times (6/12)^{1.23} = \$29.20/linear foot

  Unit Material Cost for 6" Duct = \$75.33 \times (6/12)^{1.23} = \$32.11/linear foot

**Structural Steel**

- Structural steel cost can be assumed to be the same for the “industry-typical” system as for VOC-2 since the heights and sizes of structure will be the same. Attachment C is the Eichleay estimate of structural steel required for VOC-2, annotated to show required subtotal. Based on this approach, structural steel cost for the industry-typical case is as follows:

  Purchased Structural Steel: \$287,630
  Labor for Erection of Structural Steel: \$45,273
Foundations

- Cost for foundations for the structural steel towers can be assumed to be the same for the “industry-typical” system as for VOC-2 since the heights and sizes of the structures are assumed to be the same. Attachment D is the Eichleay estimate of the foundations required for VOC-2, annotated to show the required subtotal. Pricing is based on a subcontract price including labor and materials. Based on this approach, 32 drilled concrete piers are required at a subcontract cost of $1,000 each.

Calculation of Post Project Potential to Emit Under Non-SLC Scenario
Calculation of Post Project Potential to Emit Under Non-SLC Scenario

A. Assumptions

- Each tank generally consists of two emissions units: (1) a fermentation emissions unit, and (2) a storage emissions unit.

- Maximum ethanol content of stored wine is 20%, unless stated otherwise on the existing permit.

- Post-project, all tanks at this facility can potentially be used as red or white wine fermentation tanks. The total tank volume that can potentially be used for wine fermentation is 55,193,318.

- Grape crushing capacity at this facility is 13,200 tons per day based on information provided by the applicant.

- Pressing capacity at this facility is 8,400 tons per day based on information provided by the applicant.

- Annual Post-Project Potential to Emit for fermentation operations will be calculated as a combined value reflecting potential emissions from the winery's total wine production capacity.

- The calculation approach for determining combined emission values for the fermentation operations will follow the draft District policy attached in Appendix D.

B. Emission Factors

The required emission factors for fermentation and storage operations are taken from District FYI-114, Estimating VOC Emissions from Winery Tanks:

- Annual emissions from red wine fermentation: 6.2 lb-VOC/1000 gallons annual throughput

- Annual emissions from white wine fermentation: 2.5 lb-VOC/1000 gallons annual throughput

- Annual emissions from wine storage working losses @ 14% Ethanol: 0.198 lb-VOC/1000 gallons annual throughput

- Annual emissions from wine storage working losses @ 16% Ethanol: 0.230 lb-VOC/1000 gallons annual throughput
Annual emissions from wine storage working losses @ 20% Ethanol: 0.297 lb-VOC/1000 gallons annual throughput

C. Calculations

1. Annual PE for fermentation operations

The combined Post-Project Potential to Emit for this facility’s wine fermentation operation is determined in the following sequence of calculations (see draft District policy “Calculation of the Potential to Emit for VOC Emissions from Wine Fermentation and Storage Operations” in Appendix D):

a. Potential fermentation emissions from a 100% white wine production scenario are first determined:

   White wine production capacity is determined as the lesser of the production capacities of either the crushing or pressing equipment or wine fermentation tanks at the facility:

   \[ W_W = \text{White wine production capacity (gallons per year as measured immediately after pressing)} \]

   \[ = \text{the lesser of the following three calculations:} \]

   \[ W1 = C \times D_w \times M \text{ (limited by crusher capacity)} \]

   \[ W2 = P \times D_w \times M \text{ (limited by pressing capacity)} \]

   \[ W3 = \left( V_{FW} \times D_w \right) / W_{FW} \text{ (limited by white fermenter volume)} \]

   \[ W4 = \left( V_T \times D_w \right) / R_{TW} \text{ (limited by overall tank processing)} \]

   where,

   \[ C = \text{grape crushing capacity} = 13,200 \text{ tons/day} \]

   \[ D_w = \text{days in a white wine crush season} = 120 \text{ days} \]

   \[ M = \text{amount of grape juice produced per ton of grapes crushed} = 200 \text{ gallons} \]

   \[ P = \text{pressing capacity} = 8,400 \text{ tons per day} \]

   \[ W_{FW} = \text{White fermentation period} = 10 \text{ days} \]

   \[ R_{TW} = \text{Total winery retention time for white wine,} 40 + 10 = 50 \text{ days} \]

   \[ V_{FW} = \text{total volume of white wine fermenters} = 55,193,318 \text{ gallons} \]

   \[ V_T = \text{Total Winery Cooperage} = 55,193,318 \text{ gallons} \]

   Potential white wine fermentation emissions are then determined by applying the white fermentation emission factor stated in FYI-114:

   \[ \text{PE}_{\text{whitefermentation}} = E_W \times W_W \]

   \[ E_W = \text{white wine emission factor} = 2.5 \text{ lb-VOC/1000 gal} \]

   Performing the above calculations yields

Appendix K - 2
W1 = 316.80 MG/year (million gals/year)
W2 = 201.60 MG/year
W3 = 662.32 MG/year
W4 = 132.46 MG/year

Selecting \( W_W = W_4 = 132.46 \) MG/year and applying the emission factor for white wine fermentation yields:

\[
PE_{\text{whitefermentation}} = 331,150 \text{ lb-VOC/year}
\]

b. Potential fermentation emissions from a 100% red wine production scenario are then calculated:

Red wine production capacity is determined as the lesser of the production capacities of either the crushing, pressing or tankage.

\( W_R = \) Red wine production capacity (gallons per year as measured immediately after pressing) and is the lesser of the following four calculations:

\[
W1 = C \times D_r \times M \quad \text{(limited by crusher capacity)}
\]

\[
W2 = P \times D_r \times M \quad \text{(limited by pressing capacity)}
\]

\[
W3 = \frac{(V_{FR} \times F \times D_r)}{R_{FR}} \quad \text{(limited by red fermenter volume)}
\]

\[
W4 = \frac{(V_T \times D_t)}{R_{TS}} \quad \text{(limited by overall tank processing)}
\]

C = grape crushing capacity = 13,200 tons/day

\( D_r = \) days in a red wine crush season = 120 days

F = Fill factor for red wine fermentation = 80%

M = amount of grape juice produced per ton of grapes crushed = 200 gallons

P = pressing capacity = 8,400 tons per day

\( R_{FR} = \) Red fermentation period = 5 days

\( R_{TS} = \) Total winery retention time for red wine, 40 + 5 = 45 days

\( V_{FR} = \) total volume of red wine fermenters = 55,193,318 gallons

\( V_T = \) Total Winery Cooperage = 55,193,318 gallons

Potential red wine fermentation emissions are then determined by applying the red fermentation emission factor stated above.

\[
PE_{\text{redfermentation}} = E_{fr} \times W/1,000
\]

\( E_{fr} = \) red wine emission factor = 6.2 lb-VOC/1000 gal (District Rule 4694)

Performing the above calculations yields

W1 = 316.80 MG/year (million gals/year)
W2 = 201.60 MG/year
W3 = 1,324.64 MG/year
W4 = 147.18 MG/year
Selecting \( W_R = W_4 = 147.18 \) MG/year and applying the emission factor for red wine fermentation yields:

\[ P_{E_{\text{redfermentation}}} = 912,516 \text{ lb-VOC/year} \]

c. The facility’s PE for fermentation operations is then taken to be the greater of either the white or red PE’s determined above.

\[ P_{E_{\text{fermentation}}} = \text{greater of } P_{E_{\text{whitefermentation}}} \text{ and } P_{E_{\text{redfermentation}}} \]

\[ P_{E_{\text{fermentation}}} = 912,516 \text{ lb-VOC/year} \]

2. Annual PE for storage operations

The storage emissions will be calculated using the procedure described in the District’s FYI 114. Breathing loss emissions are considered negligible for all storage tanks, since none of the tanks are subject to any significant diurnal temperature variations. The majority of the tanks (accounting for 96.3% of the total storage volume) are enclosed stainless steel tanks with pressure/vacuum relief valves and either insulation, refrigeration or both. Per FYI 114, breathing losses from insulated and/or refrigerated tanks may be ignored since the diurnal temperature swings that are primarily responsible for breathing emissions are significantly eradicated by insulation and/or refrigeration. A few of the tanks (accounting for only 3.7% of the total storage volume) are constructed of either concrete or wood. These tanks are enclosed, equipped with pressure/vacuum relief valves and located indoors. Considering that concrete and wood are by themselves insulative materials (i.e. poor conductors of heat, compared to steel), and that the tanks are located indoors, it can be concluded that these tanks are not subject to any significant diurnal temperature ranges, and therefore have negligible breathing loss emissions. Storage emissions will therefore consist only of working loss emissions.

Since the emission factors for wine storage are the same for both white and red wine, emissions from storage tank operations are determined based on the throughput of the maximum quantity of wine the facility is able to produce. In the preceding sections, it was determined that the facility’s wine production limiting factor for both red and white wines is the total cooperage (combined fermentation and storage/processing capacity). Based on cooperage, the facility’s annual red wine production capacity is higher than the white wine production capacity; hence storage emissions will be based on the red wine production capacity. Based on cooperage limitations, red wine production capacity is 147.18 million gallons per year.
Storage emissions are calculated as follows:

\[ PE_{\text{storage}} = E_s \times T \times W_R \]

Where:

\( E_s \) = wine storage emission factor based on District FYI-114 = 0.297 lb-VOC/1000 gallons of wine transferred for 20% alcohol wine

\( T \) = Total post fermentation inter-tank transfers per batch of wine = 8

\( W_R \) = maximum quantity of wine the facility can produce = 147.18 million gallons of red wine per year

\[ PE_{\text{storage}} = E_s \times T \times W_R \]
\[ = (0.297/1000) \times 8 \times (147.18) \times 10^6 \]
\[ = 349,700 \text{ lb-VOC/year} \]
Appendix L

Contemporaneous Emissions
Calculation of Creditable Contemporaneous Emissions Increase \((\text{NEI})_c\)

The following District projects are contemporaneous with the current project:

<table>
<thead>
<tr>
<th>District Project</th>
<th>Permits</th>
<th>Emissions Increase (\text{lb-VOC/year})</th>
</tr>
</thead>
<tbody>
<tr>
<td>N-1060161</td>
<td>N-2321-629-0 through 636-0</td>
<td>480</td>
</tr>
<tr>
<td>N-1070769</td>
<td>N-2321-2-4, 6-4, 7-3, 8-3, 10-3, &amp; 644-0 through 648-0</td>
<td>0</td>
</tr>
<tr>
<td>Total</td>
<td></td>
<td>480</td>
</tr>
</tbody>
</table>

Both of the above projects issued ATC's for new winery storage tanks within the contemporaneous period. The basis for the emission increase for each project is listed below:

N-1060161

Per the calculations performed in District Project N-1060161, each of tanks N-2321-629-0 through 636-0 has an annual Potential to Emit of 60 lb-VOC/year. For all eight tanks in this project, emissions increase was:

\[8 \text{ tanks} \times 60 \text{ lb-VOC/year-tank} = 480 \text{ lb-VOC/year}\]

N-1070769

Per the calculations performed in District Project N-1070769, tank N-2321-644-0 has an annual Potential to Emit of 327 lb-VOC/year, and each of tanks N-2321-645-0 through 648-0 has an annual Potential to Emit of 653 lb-VOC/year. For all six tanks in this project, emissions increase was:

\[(1 \text{ tank} \times 327 \text{ lb-VOC/year-tank}) + (4 \text{ tanks} \times 653 \text{ lb-VOC/year-tank}) = 2,939 \text{ lb-VOC/year}\]

However, the increase in emissions from these five new tanks was fully offset by an onsite reduction of a total of 2,939 lb-VOC/year from permit units N-2321-2-4, 6-4, 7-3, 8-3 and 10-3.

SUBMITTED VIA EMAIL

RE:  CWUS Title V Compliance

Dear Jonah,

Per your request yesterday, this letter is to inform you that all Constellation Wines, U.S. wineries operating within the state of California and considered major emission sources, are in compliance with Title V requirements.

For your reference the following is a list of CWUS wineries with Title V applicability.

R.M.E., Inc. – Woodbridge Winery  N-2321  
Turner Road Vintners  N-4939  
Mission Bell Winery  C-628

If you need any additional information or have any questions, feel free to contact me at (209) 369-5861.

Sincerely,

Drew Scott  
Senior Industrial Engineer  
CWUS, R.M.E-Inc., - Woodbridge Winery

San Joaquin Valley
Air Pollution Control District

AUTHORITY TO CONSTRUCT

PERMIT NO: N-2321-14-2

LEGAL OWNER OR OPERATOR: RME INC - WOODBRIDGE WINERY
MAILING ADDRESS: P O BOX 1260
WINDSOR, CA 95493

LOCATION: 5950 E WOODBRIDGE ROAD
ACAMPO, CA 95220

EQUIPMENT DESCRIPTION:
MODIFICATION OF 26,470 GALLON CONCRETE LINED ENCLOSED TOP RED AND WHITE WINE FERMENTATION
AND WINE STORAGE TANK 1 WITH PRESSURE/VACUUM RELIEF VALVE: ADD SPECIFIC LIMITING CONDITION
FOR WINE PRODUCTION OPERATIONS.

CONDITIONS

1. [1830] This Authority to Construct serves as a written certificate of conformity with the procedural requirements of 40 CFR 70.7 and 70.8 and with the compliance requirements of 40 CFR 70.6(c). [District NSR Rule] Federally Enforceable Through Title V Permit

2. [1831] Prior to operating with modifications authorized by this Authority to Construct, the facility shall submit an application to modify the Title V permit with an administrative amendment in accordance with District Rule 2520 Section 5.3.4. [District Rule 2520, 5.3.4] Federally Enforceable Through Title V Permit

3. [98] No air contaminant shall be released into the atmosphere which causes a public nuisance. [District Rule 4102]

4. The daily VOC emissions rate for fermentation shall not exceed 3.46 lb/1000 gallons. [District Rule 2201]

5. The average fermentation temperature of each batch of must fermented in this tank shall not exceed 95 degrees Fahrenheit, calculated as the average of all temperature measurements for the batch taken at least every 12 hours over the course of the fermentation. [District Rule 2201]

6. When used for wine storage, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 2201]

CONDITIONS CONTINUE ON NEXT PAGE

YOU MUST NOTIFY THE DISTRICT COMPLIANCE DIVISION AT (209) 557-6400 WHEN CONSTRUCTION IS COMPLETED AND PRIOR TO OPERATING THE EQUIPMENT OR MODIFICATIONS AUTHORIZED BY THIS AUTHORITY TO CONSTRUCT. This is NOT A PERMIT TO OPERATE. Approval or denial of a PERMIT TO OPERATE will be made after an inspection to verify that the equipment has been constructed in accordance with the approved plans, specifications and conditions of this Authority to Construct, and to determine if the equipment can be operated in compliance with all Rules and Regulations of the San Joaquin Valley Unified Air Pollution Control District. Unless construction has commenced pursuant to Rule 2050, this Authority to Construct shall expire and application shall be cancelled two years from the date of issuance. The applicant is responsible for complying with all laws, ordinances and regulations of all other governmental agencies which may pertain to the above equipment.

Seyed Sadreddin, Executive Director / APCO

DAVID WARNER, Director of Permit Services
N-2321-14-2  Nov 12, 2008  4:59PM - AIYABEU  Joint Inspection NOT Required
Northern Regional Office • 4800 Enterprise Way • Modesto, CA 95356-8718 • (209) 557-6400 • Fax (209) 557-6475
7. When this tank is used for wine storage, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, as defined in District Rule 4694, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 2201]

8. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 2201]

9. The ethanol content of wine stored in this tank shall not exceed 20 percent by volume. [District Rule 2201]

10. When this tank is used for wine storage, the daily tank throughput, in gallons, shall not exceed four times the maximum nominal tank capacity stated on the equipment description. [District Rule 2201]

11. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, the average fermentation temperature and uncontrolled fermentation emissions and fermentation emission reductions (calculated per the emission factors given in District Rule 4694). The information shall be recorded by the tank Permit to Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

12. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

13. When this tank is used for wine storage, daily throughput records, including records of filling and emptying operations, the dates of such operations, a unique identifier for each batch, the volume percent ethanol in the batch, and the volume of wine transferred, shall be maintained. [District Rules 1070 and 2201]

14. Total annual VOC emissions from all wine fermentation and wine storage operations at this facility shall not exceed 1,167,178 lb. [District Rule 2201]

15. Total annual VOC emissions from wine fermentation operations shall be determined by the following formula: Total annual VOC emissions = (Total Annual Red Wine Production - gallons) x (6.2 lb-VOC/1000 gallons) + (Total Annual White Wine Production - gallons) x (2.5 lb-VOC/1000 gallons). [District Rule 2201]

16. Total annual VOC emissions from wine storage operations may be determined using the total annual wine throughput, average number of wine transfers, and a single storage emissions factor based on the weighted average ethanol content of the annual wine throughput; or using the throughputs for different batches of wine, batch-specific number of transfers, and batch-specific storage emissions factors based on the ethanol content of each batch. [District Rule 2201]

17. Records of total annual fermentation and total annual storage emissions, including calculation methods and parameters used, shall be maintained. [District Rule 1070 and 2201]

18. Separate annual records of total red wine and total white wine produced by fermentation at this facility, based on values reported to the Alcohol and Tobacco Tax and Trade Bureau (TTB), U.S. Department of the Treasury, shall be maintained. [District Rules 1070 and 2201]

19. All records shall be retained on-site for a period of at least five years and made available for District inspection upon request. [District Rules 1070, 2201 and 4694]

10. When this tank is used for wine storage, the daily tank throughput, in gallons, shall not exceed four times the maximum nominal tank capacity stated on the equipment description. [District Rule 2201]

11. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, the average fermentation temperature and uncontrolled fermentation emissions and fermentation emission reductions (calculated per the emission factors given in District Rule 4694). The information shall be recorded by the tank Permit to Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

12. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

13. When this tank is used for wine storage, daily throughput records, including records of filling and emptying operations, the dates of such operations, a unique identifier for each batch, the volume percent ethanol in the batch, and the volume of wine transferred, shall be maintained. [District Rules 1070 and 2201]

14. Total annual VOC emissions from all wine fermentation and wine storage operations at this facility shall not exceed 1,167,178 lb. [District Rule 2201]

15. Total annual VOC emissions from wine fermentation operations shall be determined by the following formula: Total annual VOC emissions = (Total Annual Red Wine Production - gallons) x (6.2 lb-VOC/1000 gallons) + (Total Annual White Wine Production - gallons) x (2.5 lb-VOC/1000 gallons). [District Rule 2201]

16. Total annual VOC emissions from wine storage operations may be determined using the total annual wine throughput and a single storage emissions factor based on the average ethanol content of the annual wine throughput; or using the throughputs for different batches of wine and batch-specific storage emissions factors based on the ethanol content of each batch. [District Rule 2201]

17. Records of total annual fermentation and total annual storage emissions, including calculation methods and parameters used, shall be maintained. [District Rules 1070 and 2201]

18. Separate annual records of total red wine and total white wine produced by fermentation at this facility, based on values reported to the Alcohol and Tobacco Tax and Trade Bureau (TTB), U.S. Department of the Treasury, shall be maintained. [District Rules 1070 and 2201]

19. All records shall be retained on-site for a period of at least five years and made available for District inspection upon request. [District Rules 1070, 2201 and 4694]
AUTHORITY TO CONSTRUCT

PERMIT NO: N-2321-17-2

LEGAL OWNER OR OPERATOR: RME INC - WOODBRIDGE WINERY
MAILING ADDRESS: P O BOX 1260
                 WOODBRIDGE, CA 95258

LOCATION: 5950 E WOODBRIDGE ROAD
            ACAMPO, CA 95220

EQUIPMENT DESCRIPTION:
MODIFICATION OF 28,470 GALLON CONCRETE ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK 4 WITH PRESSURE/VACUUM RELIEF VALVE: ADD SPECIFIC LIMITING CONDITION FOR WINE PRODUCTION OPERATIONS.

CONDITIONS

1. {1830} This Authority to Construct serves as a written certificate of conformity with the procedural requirements of 40 CFR 70.7 and 70.8 and with the compliance requirements of 40 CFR 70.6(c). [District NSR Rule] Federally Enforceable Through Title V Permit

2. {1831} Prior to operating with modifications authorized by this Authority to Construct, the facility shall submit an application to modify the Title V permit with an administrative amendment in accordance with District Rule 2520 Section 5.3.4. [District Rule 2520, 5.3.4] Federally Enforceable Through Title V Permit

3. {98} No air contaminant shall be released into the atmosphere which causes a public nuisance. [District Rule 4102]

4. The daily VOC emissions rate for fermentation shall not exceed 3.46 lb/1000 gallons. [District Rule 2201]

5. The average fermentation temperature of each batch of must fermented in this tank shall not exceed 95 degrees Fahrenheit, calculated as the average of all temperature measurements for the batch taken at least every 12 hours over the course of the fermentation. [District Rule 2201]

6. When used for wine storage, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer’s instructions, and be permanently labeled with the operating pressure settings. [District Rule 2201]

CONDITIONS CONTINUE ON NEXT PAGE

YOU MUST NOTIFY THE DISTRICT COMPLIANCE DIVISION AT (209) 557-6400 WHEN CONSTRUCTION IS COMPLETED AND PRIOR TO OPERATING THE EQUIPMENT OR MODIFICATIONS AUTHORIZED BY THIS AUTHORITY TO CONSTRUCT. This is NOT a PERMIT TO OPERATE. Approval or denial of a PERMIT TO OPERATE will be made after an inspection to verify that the equipment has been constructed in accordance with the approved plans, specifications and conditions of this Authority to Construct, and to determine if the equipment can be operated in compliance with all Rules and Regulations of the San Joaquin Valley Unified Air Pollution Control District. Unless construction has commenced pursuant to Rule 2050, this Authority to Construct shall expire and application shall be cancelled two years from the date of issuance. The applicant is responsible for complying with all laws, ordinances and regulations of all other governmental agencies which may pertain to the above equipment.

Seyed Sadredin, Executive Director APCO

DAVID WARNER, Director of Permit Services

Northern Regional Office • 4800 Enterprise Way • Modesto, CA 95356-8718 • (209) 557-6400 • Fax (209) 557-6475
7. When this tank is used for wine storage, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, as defined in District Rule 4694, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 2201]

8. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 2201]

9. The ethanol content of wine stored in this tank shall not exceed 20 percent by volume. [District Rule 2201]

10. When this tank is used for wine storage, the daily tank throughput, in gallons, shall not exceed four times the maximum nominal tank capacity stated on the equipment description. [District Rule 2201]

11. For each batch of must fermented in this tank, the operator shall record the fermentation completion date, the total gallons of must fermented, the average fermentation temperature and uncontrolled fermentation emissions and fermentation emission reductions (calculated per the emission factors given in District Rule 4694). The information shall be recorded by the tank Permit to Operate number and by wine type, stated as either red wine or white wine. [District Rule 4694, 6.4.1]

12. When this tank is used for wine storage, the operator shall record, on a weekly basis, the total gallons of wine contained in the tank and the maximum temperature of the stored wine. [District Rule 4694, 6.4.2]

13. When this tank is used for wine storage, daily throughput records, including records of filling and emptying operations, the dates of such operations, a unique identifier for each batch, the volume percent ethanol in the batch, and the volume of wine transferred, shall be maintained. [District Rules 1070 and 2201]

14. Total annual VOC emissions from all wine fermentation and wine storage operations at this facility shall not exceed 1,167,178 lb. [District Rule 2201]

15. Total annual VOC emissions from wine fermentation operations shall be determined by the following formula: Total annual VOC emissions = (Total Annual Red Wine Production - gallons) x (6.2 lb-VOC/1000 gallons) + (Total Annual White Wine Production - gallons) x (2.5 lb-VOC/1000 gallons). [District Rule 2201]

16. Total annual VOC emissions from wine storage operations may be determined using the total annual wine throughput and a single storage emissions factor based on the average ethanol content of the annual wine throughput; or using the throughputs for different batches of wine and batch-specific storage emissions factors based on the ethanol content of each batch. [District Rule 2201]

17. Records of total annual fermentation and total annual storage emissions, including calculation methods and parameters used, shall be maintained. [District Rule 1070 and 2201]

18. Separate annual records of total red wine and total white wine produced by fermentation at this facility, based on values reported to the Alcohol and Tobacco Tax and Trade Bureau (TTB), U.S. Department of the Treasury, shall be maintained. [District Rules 1070 and 2201]

19. All records shall be retained on-site for a period of at least five years and made available for District inspection upon request. [District Rules 1070, 2201 and 4694]

EQUIPMENT DESCRIPTION:
MODIFICATION OF 30,129 GALLON CONCRETE ENCLOSED TOP RED AND WHITE WINE FERMENTATION AND WINE STORAGE TANK B WITH PRESSURE/VACUUM RELIEF VALVE: ADD SPECIFIC LIMITING CONDITION FOR WINE PRODUCTION OPERATIONS.

CONDITIONS

1. {1830} This Authority to Construct serves as a written certificate of conformity with the procedural requirements of 40 CFR 70.7 and 70.8 and with the compliance requirements of 40 CFR 70.6(c). [District NSR Rule] Federally Enforceable Through Title V Permit

2. {1831} Prior to operating with modifications authorized by this Authority to Construct, the facility shall submit an application to modify the Title V permit with an administrative amendment in accordance with District Rule 2520 Section 5.3.4. [District Rule 2520, 5.3.4] Federally Enforceable Through Title V Permit

3. {98} No air contaminant shall be released into the atmosphere which causes a public nuisance. [District Rule 4102]

4. The daily VOC emissions rate for fermentation shall not exceed 3.46 lb/1000 gallons. [District Rule 2201]

5. The average fermentation temperature of each batch of must fermented in this tank shall not exceed 95 degrees Fahrenheit, calculated as the average of all temperature measurements for the batch taken at least every 12 hours over the course of the fermentation. [District Rule 2201]

6. When used for wine storage, this tank shall be equipped with and operated with a pressure-vacuum relief valve, which shall operate within 10% of the maximum allowable working pressure of the tank, operate in accordance with the manufacturer's instructions, and be permanently labeled with the operating pressure settings. [District Rule 2201]

CONDITIONS CONTINUE ON NEXT PAGE

YOU MUST NOTIFY THE DISTRICT COMPLIANCE DIVISION AT (209) 557-6400 WHEN CONSTRUCTION IS COMPLETED AND PRIOR TO OPERATING THE EQUIPMENT OR MODIFICATIONS AUTHORIZED BY THIS AUTHORITY TO CONSTRUCT. This is NOT a PERMIT TO OPERATE. Approval or denial of a PERMIT TO OPERATE will be made after an inspection to verify that the equipment has been constructed in accordance with the approved plans, specifications and conditions of this Authority to Construct, and to determine if the equipment can be operated in compliance with all Rules and Regulations of the San Joaquin Valley Unified Air Pollution Control District. Unless construction has commenced pursuant to Rule 2050, this Authority to Construct shall expire and application shall be cancelled two years from the date of issuance. The applicant is responsible for complying with all laws, ordinances and regulations of all other governmental agencies which may pertain to the above equipment.

Seyed Sadredin, Executive Director APCO

DAVID WARNER, Director of Permit Services

7. When this tank is used for wine storage, the pressure-vacuum relief valve and storage tank shall remain in a gas-tight condition, as defined in District Rule 4694, except when the operating pressure of the tank exceeds the valve set pressure. A gas-tight condition shall be determined by measuring the gas leak in accordance with the procedures in EPA Method 21. [District Rule 2201]

8. The temperature of the wine stored in this tank shall be maintained at or below 75 degrees Fahrenheit. The temperature of the stored wine shall be determined and recorded at least once per week. For each batch of wine, the operator shall achieve the storage temperature of 75 degrees Fahrenheit or less within 60 days after completing fermentation, and shall maintain records to show when the required storage temperature of 75 degrees Fahrenheit or less was achieved. [District Rule 2201]

9. The ethanol content of wine stored in this tank shall not exceed 20 percent by volume. [District Rule 2201]
