Re: Notice of Preliminary Decision - Authority to Construct
Project Number: S-1122041

Dear Mr. Oliver:

Enclosed for your review and comment is the District’s analysis of San Joaquin Facilities Management’s (SJFM) application for an Authority to Construct for a new 2.29 MMBtu/hr Coanda effect flare, at SJFM's Kern County Light Oil Central stationary source.

The notice of preliminary decision for this project will be published approximately three days from the date of this letter. Please submit your written comments on this project within the 30-day public comment period which begins on the date of publication of the public notice.

Thank you for your cooperation in this matter. If you have any questions regarding this matter, please contact Mr. Dan Klevann of Permit Services at (661) 392-5607.

Sincerely,

David Warner
Director of Permit Services

Enclosure
NOTICE OF PRELIMINARY DECISION
FOR THE PROPOSED ISSUANCE OF
AN AUTHORITY TO CONSTRUCT

NOTICE IS HEREBY GIVEN that the San Joaquin Valley Unified Air Pollution Control District solicits public comment on the proposed issuance of Authority to Construct to San Joaquin Facilities Management for a new 2.29 MMBtu/hr Coanda effect flare, at SJFM's Kern County Light Oil Central stationary source.

The analysis of the regulatory basis for this proposed action, Project #S-1122041, is available for public inspection at http://www.valleyair.org/notices/public_notices_idx.htm and the District office at the address below. Written comments on this project must be submitted within 30 days of the publication date of this notice to DAVID WARNER, DIRECTOR OF PERMIT SERVICES, SAN JOAQUIN VALLEY UNIFIED AIR POLLUTION CONTROL DISTRICT, 34946 Flyover Court, Bakersfield, CA 93308.
San Joaquin Valley Air Pollution Control District
Authority to Construct Application Review

New Flare

Facility Name: San Joaquin Facilities Management
Mailing Address: 5400 Rosedale Hwy
Bakersfield, CA 93308

Engineer: Dolores Gough
Lead Engineer: Dan Klevann

Contact Person: Bill Oliver or Scott Faulkenburg (Envirotech)
Telephone: 661-631-8713 or 661-377-0073

Application #(s): S-2980-77-0
Project #: 1122041
Deemed Complete: 6/21/2012

I. Proposal

San Joaquin Facilities Management (SJFM) is requesting an Authority to Construct (ATC) permit for the installation of a 2.29 MMBtu/hr produced gas Coanda-effect flare. The flare will be used to incinerate excess produced gas when the sales gas line is not available. To mitigate the flare’s emissions increase, SJFM will surrender tank PTO S-2980-26.

II. Applicable Rules

Rule 2201 New and Modified Stationary Source Review Rule (4/21/11)
Rule 2520 Federally Mandated Operating Permits (6/21/01)
Rule 2530 Federally Enforceable Potential to Emit (6/10/10)
Rule 4001 New Source Performance Standards (4/14/99)
Rule 4101 Visible Emissions (2/17/05)
Rule 4102 Nuisance (12/17/92)
Rule 4201 Particulate Matter Concentration (12/17/92)
Rule 4301 Fuel Burning Equipment (12/17/92)
Rule 4311 Flares (6/18/09)
Rule 4409 Components at Light Crude Oil Production Facilities, Natural Gas Production Facilities, and Natural Gas Processing Facilities (4/20/05)

CH&SC 41700 Health Risk Assessment
CH&SC 42301.6 School Notice

Public Resources Code 21000-21177: California Environmental Quality Act (CEQA)
California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000-15387: CEQA Guidelines

III. Project Location

The flare is located at the SJFM’s Arco Lease facility within the southwest quarter of Section 10, Township 29S, Range 26E within their Light Oil Central stationary source. The equipment is not located within 1,000 feet of the outer boundary of a K-12 school. Therefore, the public
notification requirement of California Health and Safety Code 42301.6 is not applicable to this project.

IV. Process Description

SJFM operates a crude oil production facility for the processing and storage of crude oil produced at the Rosedale Field, Arco Lease. Produced gas and oil are processed through a separator, where gas is removed and sent to a sales gas line. Produced water is sent to a wastewater tank and injected in water injection wells. The oil is transported to two crude oil storage tanks before shipping offsite via trucks. When the sales gas line is not available, the flare will be used.

V. Equipment Listing

Pre-Project Equipment Description: (see PTO in Appendix A):
S-2980-26-1: 125 BBL SUMP TANK

Proposed Equipment:
S-2980-77-0: 2.29 MMBTU/HR COANDA-EFFECT FLARE WITH AUTO-IGNITION (ARCO LEASE)

VI. Emission Control Technology Evaluation

The subject flare has the potential to emit NOx, SOx, PM10, CO, and VOC emissions due to the incineration of produced gas generated by oil production activities.

The flare will be equipped with a Coanda-effect tip which draws in large amounts of air in order to increase turbulent mixing of fuel and air which promotes complete hydrocarbon combustion. This reduces carbon monoxide (CO) emissions and smoke/particulate matter (PM10) which are caused by high temperatures and incomplete combustion.

To ensure that combustible gases are incinerated, the flare’s outlet is equipped with an automatic ignition system.

VII. General Calculations

A. Assumptions

Tank S-2980-26-1:
- Only VOCs are emitted from the tank
- Operational time: 24 hours per day
- Vapor Molecular Weight: 50
- Throughput: 50 barrels per day (PTO)
- RVP: 5 psia
- Equipped with fixed-roof with PV vent (per applicant)
Flare S-2980-77-0:
- Flared gas higher heating value: 1100 Btu/scf (Supplemental application)
- Flared gas S content: 5 gr S/100 scf (Supplemental application)
- Emissions from combustion of pilot gas are neglected
- Flared gas is limited to 9.125 MMscf/yr or 10,038 MMBtu/yr (HRA limit)

B. Emission Factors

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>lb/MMBtu</th>
<th>Source of Emission Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td>0.068</td>
<td>EPA AP-42/FYI-83</td>
</tr>
<tr>
<td>CO</td>
<td>0.370</td>
<td>EPA AP-42/FYI-83</td>

<td>EPA AP-42/FYI-83</td>
</tr>
<tr>
<td>SOx (as SO2)*</td>
<td>0.014</td>
<td>Mass balance</td>
</tr>
</tbody>
</table>

$^*SOx = (5.0 \text{ gr-S/100 scf})(10^6 \text{ scf fuel/MMSCF})(\text{lb/7000 gr})(\text{MMSCF/1,100 MMBtu})(64 \text{ lb-SO}_2/32 \text{ lb-S}) = 0.013 \text{ round to 0.014 lb/MMBtu (per applicant)}$

C. Calculations

1. Pre-Project Potential to Emit (PE1)

   Tank S-2980-26-1: (See calculations in Appendix B)

   Daily PE1 = 3.5 lb-VOC/day
   Annual PE1 = 1,265 lb-VOC/yr

   Flare S-2980-77-0: Since the flare is a new equipment, PE1 = 0 for all pollutants.

2. Post Project Potential to Emit (PE2)

   Tank S-2980-26-1: PTO will be surrendered, PE2 = 0

   Flare S-2980-77-0:

   Daily PE2 = EF (lb/MMBtu) x MMBtu/hr x 24 hr/day
   Annual PE2 = EF (lb/MMBtu) x MMBtu/yr
### Flare S-2980-77-0

<table>

</tr>
</tbody>
</table>

#### Greenhouse Gas Emissions (GHG) Increase:

The GHG Emission Factor is 0.05368 metric tons CO$_2$e/MMBtu (from ARB for natural gas with HHV of 1,100 Btu/scf).

CO$_2$e mton/yr = 0.05368 mton CO$_2$e/MMBtu x 10,038 MMBtu/yr

= 539 mton CO$_2$e/yr

As shown in the above calculation, the GHG as CO$_2$e is above the District threshold of 230 metric tons of CO$_2$e/yr. To address the potential increase in GHG emissions, SJFM is proposing to comply with the best performance standard (BPS) developed by the District for VOC control devices. The produced gas will be transferred to sales gas pipeline and will be incinerated in the flare if sales gas pipeline is not available (Appendix I– BPS for VOC Control/Gas Disposal)

#### 3. Pre-Project Stationary Source Potential to Emit (SSPE1)

Pursuant to District Rule 2201, the SSPE1 is the Potential to Emit (PE) from all units with valid Authorities to Construct (ATC) or Permits to Operate (PTO) at the Stationary Source and the quantity of Emission Reduction Credits (ERC) which have been banked since September 19, 1991 for Actual Emissions Reductions (AER) that have occurred at the source, and which have not been used on-site.

The SSPE1 is taken from projects S-1114893 and 1121897, the last ATC projects to be finalized.

<table>
<thead>

<td>1,754</td>
<td>1,461</td>
<td>65,837</td>
<td>&gt;&gt;20,000</td>
</tr>
</tbody>
</table>

#### 4. Post Project Stationary Source Potential to Emit (SSPE2)

Pursuant to District Rule 2201, the SSPE2 is the PE from all units with valid ATCs or PTOs at the Stationary Source and the quantity of ERCs which have been banked since
September 19, 1991 for AER that have occurred at the source, and which have not been used on-site.

<table>
<thead>

</tr>
</tbody>
</table>

5. Major Source Determination

Pursuant to District Rule 2201, a Major Source is a stationary source with a SSPE2 equal to or exceeding one or more of the following threshold values. However, for the purposes of determining major source status, the SSPE2 shall not include the quantity of ERCs which have been banked since September 19, 1991 for AER that have occurred at the source, and which have not been used on-sites.

<table>
<thead>
<tr>
<th>Major Source Determination (lb/year)</th>
<th>NO\textsubscript{X}</th>
<th>SO\textsubscript{X}</th>

<td>200,000</td>
<td>20,000</td>
</tr>
<tr>
<td>Major Source?</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

As seen in the table above, the facility is an existing Major Source for VOC emissions and will remain so as a result of this project.

6. Baseline Emissions (BE)

The BE calculation (in lbs/year) is performed pollutant-by-pollutant for each unit within the project, to calculate the QNEC and if applicable, to determine the amount of offsets required.

Pursuant to District Rule 2201, BE = PE1 for:
- Any unit located at a non-Major Source,
- Any Highly-Utilized Emissions Unit, located at a Major Source,
- Any Fully-Offset Emissions Unit, located at a Major Source, or
- Any Clean Emissions Unit, located at a Major Source.

otherwise,

BE = Historic Actual Emissions (HAE), calculated pursuant to District Rule 2201.

As shown in Section VII.C.5 above, the facility is not a Major Source for NO\textsubscript{X}, SO\textsubscript{X}, PM\textsubscript{10} and CO pollutant; therefore BE=PE1 for NO\textsubscript{X}, SO\textsubscript{X}, PM\textsubscript{10} and CO.
As shown in Section VII.C.5 above, the facility is a major source for VOC emissions.

**BE for VOC:**

**Tank S-2980-26-1: Clean Emissions Unit, Located at a Major Source**

Pursuant to Rule 2201, a Clean Emissions Unit is defined as an emissions unit that is "equipped with an emissions control technology with a minimum control efficiency of at least 95% or is equipped with emission control technology that meets the requirements for achieved-in-practice BACT as accepted by the APCO during the five years immediately prior to the submission of the complete application.

Tanks S-2980-26 is equipped with PV-vent set to within 10% of maximum allowable pressure, which meets the requirements for achieved-in-practice BACT for VOC emissions (see BACT Guideline 7.3.1 in Appendix D). Therefore, BE = PE1.

**Flare S-2980-77-0:** Since the flare is a new emissions unit, its BE = 0 for VOC.

7. **SB 288 Major Modification**

SB 288 Major Modification is defined in 40 CFR Part 51.165 as "any physical change in or change in the method of operation of a major stationary source that would result in a significant net emissions increase of any pollutant subject to regulation under the Act."

Since this facility is a major source for VOC, the project’s PE2 is compared to the SB 288 Major Modification Thresholds in the following table in order to determine if the SB 288 Major Modification calculation is required.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>SB 288 Major Modification Thresholds</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Project PE2 (lb/year)</td>
</tr>
<tr>
<td>VOC</td>
<td>632</td>
</tr>
</tbody>
</table>

8. **Federal Major Modification**

District Rule 2201 states that a Federal Major Modification is the same as a "Major Modification" as defined in 40 CFR 51.165 and part D of Title I of the CAA.

The determination of Federal Major Modification is based on a two-step test. For the first step, only the emission increases are counted. Emission decreases may not cancel out the increases for this determination.

**Step 1**

For new emissions units, the increase in emissions is equal to the PE2 for each new unit included in this project.
### Federal Major Modification Thresholds for Emission Increases

<table>
<thead>
<tr>
<th>New Unit</th>
<th>Total Emissions Increases (lb-VOC/yr)</th>
<th>Thresholds (lb-VOC/yr)</th>
<th>Federal Major Modification?</th>
</tr>
</thead>
<tbody>
<tr>
<td>S-2980-77-0</td>
<td>632</td>
<td>0</td>
<td>Yes</td>
</tr>
</tbody>
</table>

If there is any emission increases in NO\textsubscript{x} or VOC, this project is a Federal Major Modification and no further analysis is required. There is an increase in VOC; therefore, this project is a federal major modification.

### 9. Quarterly Net Emissions Change (QNEC)

The QNEC is calculated solely to establish emissions that are used to complete the District’s PAS emissions profile screen. Detailed QNEC calculations are included in Appendix C.

### VIII. Compliance

#### Rule 2201  New and Modified Stationary Source Review Rule

##### A. Best Available Control Technology (BACT)

1. **BACT Applicability**

   BACT requirements are triggered on a pollutant-by-pollutant basis and on an emissions unit-by-emissions unit basis. Unless specifically exempted by Rule 2201, BACT shall be required for the following actions*:

   a. Any new emissions unit with a potential to emit exceeding two pounds per day,
   b. The relocation from one Stationary Source to another of an existing emissions unit with a potential to emit exceeding two pounds per day,
   c. Modifications to an existing emissions unit with a valid Permit to Operate resulting in an AIPE exceeding two pounds per day, and/or
   d. Any new or modified emissions unit, in a stationary source project, which results in an SB 288 Major Modification or a Federal Major Modification, as defined by the rule.

*Except for CO emissions from a new or modified emissions unit at a Stationary Source with an SSPE2 of less than 200,000 pounds per year of CO.

2. **New emissions units – PE > 2 lb/day**

   As seen in Section VII.C.2 above, the applicant is proposing to install a new flare with a PE greater than 2 lb/day for NO\textsubscript{x}, CO and VOC. BACT is triggered for NO\textsubscript{x}, and VOC only since the PEs are greater than 2 lbs/day. BACT is not triggered for CO since the SSPE2 for CO is not greater than 200,000 lbs/year, as demonstrated in Section VII.C.5 above.
b. Relocation of emissions units – PE > 2 lb/day

As discussed in Section I above, there are no emissions units being relocated from one stationary source to another; therefore, BACT is not triggered.

c. Modification of emissions units – AIPE > 2 lb/day

\[ \text{AIPE} = \text{PE2} - \text{HAPE} \]

Where,
\[ \text{AIPE} \quad = \text{Adjusted Increase in Permitted Emissions, (lb/day)} \]
\[ \text{PE2} \quad = \text{Post-Project Potential to Emit, (lb/day)} \]
\[ \text{HAPE} \quad = \text{Historically Adjusted Potential to Emit, (lb/day)} \]

\[ \text{HAPE} = \text{PE1} \times (\text{EF2/EF1}) \]

Where,
\[ \text{PE1} \quad = \text{The emissions unit's Potential to Emit prior to modification or relocation, (lb/day)} \]
\[ \text{EF2} \quad = \text{The emissions unit's permitted emission factor for the pollutant after modification or relocation. If EF2 is greater than EF1 then EF2/EF1 shall be set to 1} \]
\[ \text{EF1} \quad = \text{The emissions unit's permitted emission factor for the pollutant before the modification or relocation} \]

\[ \text{AIPE} = \text{PE2} - (\text{PE1} \times (\text{EF2} / \text{EF1})) \]

There is no unit that is being modified on this project.

d. SB 288/Federal Major Modification

As discussed in Section VII.C.7 above, this project does constitute a Federal Major Modification for VOC emissions. Therefore, BACT is triggered for VOC for the flare.

2. BACT Guideline

BACT Guideline 1.4.2 applies to “Waste Gas Flare –Incinerating Produced Gas” (See Appendix D)

3. Top-Down BACT Analysis

Per Permit Services Policies and Procedures for BACT, a Top-Down BACT analysis shall be performed as a part of the application review for each application subject to the BACT requirements pursuant to the District’s NSR Rule.
Pursuant to the attached Top-Down BACT Analysis (see Appendix D), BACT has been satisfied with the following:

\[ \text{NO}_x: \text{Coanda-effect burner} \]
\[ \text{VOC: Coanda-effect burner} \]

**B. Offsets**

1. **Offset Applicability**

Offset requirements shall be triggered on a pollutant by pollutant basis and shall be required if the SSPE2 equals to or exceeds the offset threshold levels in Table 4-1 of Rule 2201.

The SSPE2 is compared to the offset thresholds in the following table.

<table>
<thead>
<tr>
<th>Offset Determination (lb/year)</th>
<th>NOx</th>
<th>SOx</th>
<th>PM10</th>
<th>CO</th>
<th>VOC</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSPE2</td>
<td>16,600</td>
<td>1,895</td>
<td>1,694</td>
<td>73,345</td>
<td>&gt;&gt;20,000</td>
</tr>
<tr>
<td>Offset Thresholds</td>
<td>20,000</td>
<td>54,750</td>
<td>29,200</td>
<td>200,000</td>
<td>20,000</td>
</tr>
<tr>
<td>Offsets triggered?</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

2. **Quantity of Offsets Required**

As seen above, the facility is an existing Major Source for VOC and the SSPE2 is greater than the offset thresholds. Therefore, offset calculations will be required for this project.

The quantity of offsets in pounds per year for VOC is calculated as follows for sources with an SSPE1 greater than the offset threshold levels before implementing the project being evaluated.

\[ \text{Offsets Required (lb/year)} = (\Sigma[\text{PE2} - \text{BE}] + \text{ICCE}) \times \text{DOR}, \text{ for all new or modified emissions units in the project,} \]

Where,
\[ \text{PE2} = \text{Post Project Potential to Emit, (lb/year)} \]
\[ \text{BE} = \text{Baseline Emissions, (lb/year)} \]
\[ \text{ICCE} = \text{Increase in Cargo Carrier Emissions, (lb/year)} \]
\[ \text{DOR} = \text{Distance Offset Ratio, determined pursuant to Section 4.8} \]

\[ \text{BE} = \text{PE1 for:} \]
- Any unit located at a non-Major Source,
- Any Highly-Utilized Emissions Unit, located at a Major Source,
- Any Fully-Offset Emissions Unit, located at a Major Source, or
- Any Clean Emissions Unit, Located at a Major Source.
otherwise,

BE = HAE

As shown in Section VII.C.6 above, the BE for VOC from the units are equal to the PE1.

Offsets Required (lb/year) = (∑ [PE2 – BE] + ICCE) x DOR

PE2 (VOC) = PE2 (tank) + PE2 (flare) = 0 + 632 = 632 lb/yr
BE (VOC) = PE1 (tank) + PE1 (flare) = 1,265 + 0 = 1,265 lb/yr
ICCE = 0 lb/year

Offsets Required (lb/year) = ([632 – 1,265] + 0) x DOR
= - 633 lb VOC/year (or zero)

As demonstrated in the calculation above, the amount of offsets is zero. Therefore, offsets will not be required for this project.

C. Public Notification

1. Applicability

Public noticing is required for:

a. New Major Sources, Federal Major Modifications, and SB 288 Major Modifications,
b. Any new emissions unit with a Potential to Emit greater than 100 pounds during any one day for any one pollutant,
c. Any project which results in the offset thresholds being surpassed, and/or
d. Any project with an SSIPR of greater than 20,000 lb/year for any pollutant.

a. New Major Sources, Federal Major Modifications, and SB 288 Major Modifications

New Major Sources are new facilities, which are also Major Sources. Since this is not a new facility, public noticing is not required for this project for New Major Source purposes. However, as demonstrated in VII.C.7, this project is a Federal Major Modification. Therefore, public noticing for Federal Major Modification purposes is required.

b. PE > 100 lb/day

Applications which include a new emissions unit with a PE greater than 100 pounds during any one day for any pollutant will trigger public noticing requirements. As seen in Section VII.C.2 above, this project does not include a new emissions unit which has daily emissions greater than 100 lb/day for any pollutant, therefore public noticing for PE > 100 lb/day purposes is not required.
c. Offset Threshold

The SSPE1 and SSPE2 are compared to the offset thresholds in the following table.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>SSPE1 (lb/year)</th>
<th>SSPE2 (lb/year)</th>
<th>Offset Threshold</th>
<th>Public Notice Required?</th>

</tbody>
</table>

As detailed above, there were no thresholds surpassed with this project; therefore, public noticing is not required for offset purposes.

d. SSIPE > 20,000 lb/year

Public notification is required for any permitting action that results in a SSIPE of more than 20,000 lb/year of any affected pollutant. According to District policy, the SSIPE = SSPE2 – SSPE1. The SSIPE is compared to the SSIPE Public Notice thresholds in the following table.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>SSPE1 (lb/year)</th>
<th>SSPE2 (lb/year)</th>
<th>SSIPE (lb/year)</th>
<th>SSIPE Public Notice Threshold</th>
<th>Public Notice Required?</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO\textsubscript{x}</td>
<td>15,917</td>
<td>16,600</td>
<td>683</td>
<td>20,000 lb/year</td>
<td>No</td>
</tr>
<tr>
<td>SO\textsubscript{x}</td>
<td>1,754</td>
<td>1,895</td>
<td>141</td>
<td>20,000 lb/year</td>
<td>No</td>
</tr>
<tr>
<td>PM\textsubscript{10}</td>
<td>1,614</td>
<td>1,694</td>
<td>80</td>
<td>20,000 lb/year</td>
<td>No</td>
</tr>
<tr>
<td>CO</td>
<td>69,631</td>
<td>73,345</td>
<td>3,714</td>
<td>20,000 lb/year</td>

</tr>
<tr>
<td>VOC</td>
<td>&gt;20,000</td>
<td>&gt;20,000</td>
<td>0</td>
<td>20,000 lb/year</td>
<td>No</td>
</tr>
</tbody>
</table>

As demonstrated above, the SSIPE for all pollutants is not greater than 20,000 lb/year; therefore, public noticing for SSIPE purposes is required.

2. Public Notice Action

As discussed above, public noticing is required for this project for federal major modification purposes.

D. Daily Emission Limits (DEls)

DEls and other enforceable conditions are required by Rule 2201 to restrict a unit’s maximum daily emissions, to a level at or below the emissions associated with the maximum design capacity. The DEL must be contained in the latest ATC and contained in or enforced by the latest PTO and enforceable, in a practicable manner, on a daily basis.
DELs are also required to enforce the applicability of BACT. The following conditions will be on the new ATC to ensure compliance with this rule:

- Emission rates from flare shall not exceed any of the following: PM10: 0.008 lb/MMBtu, SOx (as SO2): 0.014 lb/MMBtu, NOx (as NO2): 0.068 lb/MMBtu, VOC: 0.063 lb/MMBtu, CO: 0.37 lb/MMBtu. [District Rule 2201]

- Sulfur content of produced gas combusted shall not exceed 5.0 gr/100 scf. [District Rule 2201]

E. Compliance Assurance

1. Source Testing

Pursuant to District Policy APR 1705, source testing is not required to demonstrate compliance with Rule 2201.

2. Monitoring

The following monitoring is required to demonstrate compliance with Rule 2201.

- The flared gas sulfur concentration shall be determined annually using one of the following test methods: ASTM D1072, ASTM D3246, ASTM D6228 (GC-FPD), double GC for H2S and mercaptans, or equivalent test method with prior District approval. [District Rule 2201] N

- Higher heating value of flared gas shall be determined using ASTM D 1826 or D 1945 in conjunction with ASTM D 3588. [District Rules 1070 and 2201] N

3. Recordkeeping

Recordkeeping is required to demonstrate compliance with the offset, public notification and daily emission limit requirements of Rule 2201. The following condition(s) are listed on the permit to operate:

- Permittee shall keep accurate daily and annual records of flare gas volumes, sulfur content, and higher heating value of flared gas and such records shall be retained for a period of 5 years and be made readily available for District inspection upon request. [District Rule 2201] N

4. Reporting

No reporting is required to demonstrate compliance with Rule 2201.

F. Ambient Air Quality Analysis (AAQA)

An AAQA shall be conducted for the purpose of determining whether a new or modified Stationary Source will cause or make worse a violation of an air quality standard. The
District’s Technical Services Division conducted the required analysis. Refer to Appendix E of this document for the AAQA summary sheet.

The proposed location is in an attainment area for NO\textsubscript{x}, CO, and SO\textsubscript{x}. As shown by the AAQA summary sheet the proposed equipment will not cause a violation of an air quality standard for NO\textsubscript{x}, CO, or SO\textsubscript{x}.

Technical Services performed modeling for criteria pollutants CO, NO\textsubscript{x}, SO\textsubscript{x} and PM\textsubscript{10}, as well as a RMR. The following parameters were used:

<table>
<thead>
<tr>
<th>Analysis Parameters</th>
<th>Unit 77-0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack Height (m)</td>
<td>6.1</td>
</tr>
<tr>
<td>Stack Diameter (m)</td>

</tbody>
</table>

*Results were taken from the attached FSD spreadsheet.
\textsuperscript{1}The project was compared to the 1-hour NO\textsubscript{2} National Ambient Air Quality Standard that became effective on April 12, 2010 using the District's approved procedures. The criteria pollutant 1-hour value passed using TIER I NO\textsubscript{2} NAAQS modeling.
\textsuperscript{2}The project was compared to the 1-hour SO\textsubscript{2} National Ambient Air Quality Standard that became effective on August 23, 2010 using the District’s approved procedures.
\textsuperscript{3}The maximum predicted concentration for emissions of these criteria pollutants from the proposed unit are below EPA’s level of significance as found in 40 CFR Part 51.165 (b)(2).

**G. Compliance Certification**

Section 4.15.2 of this Rule requires the owner of a new Major Source or a source undergoing a Title I Modification to demonstrate to the satisfaction of the District that all other Major Sources owned by such person and operating in California are in compliance or are on a schedule for compliance with all applicable emission limitations and standards. As discussed in Section VIII above, this facility is a new major source and this project does constitute a Title I modification, therefore this requirement is applicable. SJFM compliance certification is included in Appendix F.

**H. Alternate Siting Analysis**

The current project occurs at an existing facility. The applicant proposes to install a new flare.
Since the project will provide a flare to be used at the same location, the existing site will result in the least possible impact from the project. Alternative sites would involve the relocation and/or construction of various support structures on a much greater scale, and would therefore result in a much greater impact.

Rule 2520  Federally Mandated Operating Permits

Since this facility's VOC emissions exceed the major source thresholds of District Rule 2201, this facility is a major source. SJFM, however has elected to comply with Rule 2530. Therefore, the facility is exempt from the requirements of Rule 2520.

Rule 2530  Federally Enforceable Potential to Emit

The purpose of this rule is to restrict the emissions of a stationary source so that the source may elect to be exempt from the requirements of Rule 2520. Pursuant to Rule 2530, since this facility has elected exemption from the requirements of Rule 2520 by ensuring actual emissions from the stationary source in every 12-month periods to not exceed the following: ½ the major source thresholds for NOx, VOCs, CO, and PM$_{10}$; 50 tons per year SO2; 5 tons per year of a single HAP; 12.5 tons per year of any combination of HAPs; 50 percent of any lesser threshold for a single HAP as the EPA may establish by rule; and 50 percent of the major source threshold for any other regulated air pollutant not listed in Rule 2530.

Rule 4001  New Source Performance Standards (NSPS)

40 CFR 60 Subpart Kb Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984

This subpart applies to oil tanks with a capacity greater than 10,000 barrels. Since the tank in this project does not exceed 10,000 barrels, this subpart is not applicable to this project.

There are no Subparts of 40 CFR 60 applicable to Flares.

Rule 4101  Visible Emissions

Rule 4101 states that no air contaminant shall be discharged into the atmosphere for a period or periods aggregating more than three minutes in any one hour which is as dark as, or darker than, Ringelmann 1 or 20% opacity.

As long as the equipment is properly maintained and operated, compliance with visible emissions limits is expected under normal operating conditions.

Rule 4102  Nuisance

Rule 4102 prohibits discharge of air contaminants which could cause injury, detriment, nuisance or annoyance to the public. Public nuisance conditions are not expected as a result
of these operations, provided the equipment is well maintained. Therefore, compliance with this rule is expected.

**California Health & Safety Code 41700 (Health Risk Assessment)**

District Policy APR 1905 — *Risk Management Policy for Permitting New and Modified Sources* specifies that for an increase in emissions associated with a proposed new source or modification, the District perform an analysis to determine the possible impact to the nearest resident or worksite.

An HRA is not required for a project with a total facility prioritization score of less than or equal to one. According to the Technical Services Memo for this project *(Appendix E)*, the total facility prioritization score including this project was greater than one. Therefore, an HRA was required to determine the short-term acute and long-term chronic exposure from this project.

The cancer risk for this project is shown below:

<table>
<thead>
<tr>
<th>HRA Summary</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>Cancer Risk</td>
</tr>
<tr>
<td>S-2980-77-0</td>
<td>2.38 per million</td>
</tr>
</tbody>
</table>

**Discussion of T-BACT**

BACT for toxic emission control (T-BACT) is required if the cancer risk exceeds one in one million. As demonstrated above, T-BACT is required for this project because the HRA indicates that the risk is above the District’s thresholds for triggering T-BACT requirements.

For this project T-BACT is triggered for VOC. T-BACT is satisfied with BACT for VOC *(see Appendix E)*, which is the use of flare with Coanda effect burner. Therefore, compliance with the District’s Risk Management Policy is expected.

District policy APR 1905 also specifies that the increase in emissions associated with a proposed new source or modification not have acute or chronic indices, or a cancer risk greater than the District’s significance levels (i.e. acute and/or chronic indices greater than 1 and a cancer risk greater than 10 in a million). As outlined by the HRA Summary in *Appendix E* of this report, the emissions increases for this project was determined to be less than significant.

The following conditions will be on the permit to ensure that human health risks will not be exceeded:

- The exhaust stack shall vent vertically upward. The vertical exhaust flow shall not be impeded by a rain cap (flapper ok), roof overhang, or any other obstruction. [District Rule 4102]
- Total quantity of produced/natural gas combusted shall not exceed 9.125 MMscf/yr. [District Rule 4102]

**Rule 4201 Particulate Matter Concentration**

Section 3.1 prohibits discharge of dust, fumes, or total particulate matter into the atmosphere from any single source operation in excess of 0.1 grain per dry standard cubic foot.

The concentration of particulate matter in the flare's exhaust can be calculated given the following data:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>F-Factor for Flared Gas</td>
<td>8,604 dscf/MMBtu at 60 °F</td>
</tr>
<tr>
<td>PM$_{10}$ Emission Factor</td>
<td>0.008 lb-PM$_{10}$/MMBtu</td>
</tr>
<tr>
<td>Percentage of PM as PM$_{10}$ in Exhaust</td>
<td>100%</td>
</tr>
<tr>
<td>Exhaust Oxygen (O$_2$) Concentration</td>
<td>3%</td>
</tr>
<tr>
<td>Excess Air Correction to F Factor</td>
<td>20.9 ÷ (20.9 - 3) = 1.17</td>
</tr>
</tbody>
</table>

\[
\begin{align*}
\left( \frac{0.008 \text{lb} \cdot \text{PM}}{\text{MMBtu}} \times \frac{7,000 \text{ grain}}{\text{lb}} \right) \times \frac{8,604 \text{ ft}^3}{\text{MMBtu}} \times 1.17 &= 0.006 \frac{\text{grain} \cdot \text{PlD}}{\text{ft}^3} \\
&= 0.006 \text{ grain} / \text{dscf}
\end{align*}
\]

Since 0.006 grain/dscf is less than 0.1 grain/dscf, compliance with District Rule 4201 is expected and the following condition will be listed on the flare's permit to ensure compliance.

- \{(14) Particulate matter emissions shall not exceed 0.1 grains/dscf in concentration. [District Rule 4201]

**Rule 4301 Fuel Burning Equipment**

This rule specifies maximum emission rates in lb/hr for SO$_2$, NO$_2$, and combustion contaminants (defined as total PM in Rule 1020). This rule also limits combustion contaminants to ≤ 0.1 gr/scf. According to AP 42 (Table 1.4-2, footnote c), all PM emissions from natural gas and LPG combustion are less than 1 μm in diameter.

The following table compares the Flare's emissions with Rule 4301 limits.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Flare Emissions (lb/hr)</th>
<th>Rule 4301 Limits (lb/hr)</th>
<th>Compliant?</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO$_2$</td>
<td>0.2</td>
<td>140</td>
<td>Yes</td>
</tr>
<tr>
<td>SO$_2$</td>
<td>0.03</td>
<td>200</td>
<td>Yes</td>
</tr>
<tr>
<td>Total PM</td>
<td>0.02</td>
<td>200</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Since none of the Rule 4301 limits are exceeded, compliance with Rule 4301 is expected. Since the proposed emission limits already placed on the flare permit are much more stringent, no additional conditions will be listed.

**Rule 4311 - Flares**

Rule 4311 limits the emissions of volatile organic compounds (VOCs) and oxides of nitrogen (NOx), and sulfur from the operation of flares.

Section 5.1 states flares permitted to operate only during an emergency are not subject to the requirements of Section 5.6 and 5.7. The flare in this project is not an emergency flare; therefore, Sections 5.6 and 5.7 are applicable.

Section 5.2 requires that the flame be present at all times when combustible gases are vented through the flare. The following condition will be listed on the ATCs to ensure compliance:

- A flame shall be present at all times when combustible gases are vented through the flare. [District Rule 4311]

Section 5.3 requires that the flare outlet be equipped with an automatic ignition system, or operate with a pilot flame present at all times when combustible gases are vented through the flare, except during purge periods for automatic-ignition equipped flares. The following condition will be listed on the ATCs to ensure compliance:

- Flare outlet shall be equipped with an automatic ignition system, or, shall operate with a pilot flame present at all times when combustible gases are vented through the flare, except during purge periods for automatic-ignition equipped flares. [District Rule 4311]

Section 5.4 requires that except for flares equipped with a flow-sensing ignition system, a heat sensing device such as a thermocouple, ultraviolet beam sensor, infrared sensor, or an alternative equivalent device, capable of continuously detecting at least one pilot flame or the flame flame is present shall be installed and operated. The flare is equipped with an automatic (flow-sensing) ignition system; therefore, this section does not apply.

Section 5.5 requires flares that use flow-sensitive automatic ignition systems and which do not use a continuous pilot flame to use purge gas for purging. The following condition will be listed on the ATCs to ensure compliance:

- If the flare uses a flow-sensing automatic ignition system and does not use a continuous flame pilot, the flare shall use purge gas for purging. [District Rule 4311]

Section 5.8 states that Effective on and after July 1, 2011, flaring is prohibited unless it is consistent with an approved flare minimization plan (FMP), pursuant to Section 6.5, and all commitments listed in that plan have been met.

Subsection 6.5.1 states that by July 1, 2010, the operator of a petroleum refinery flare or any flare that has a flaring capacity of greater than or equal to 5.0 MMBtu per hour shall submit a flare minimization plan (FMP) to the APCO for approval.
Subsection 6.5.2 states that every five years after the initial FMP submittal, the operator shall submit an updated FMP for each flare to the APCO for approval. The current FMP shall remain in effect until the updated FMP is approved by the APCO.

The proposed flare has a flaring capacity of less than 5.0 MMBtu/hr; therefore is not subject to this section of the rule.

Section 5.9 cites Petroleum Refinery SO2 Performance Targets. The flare does not serve a petroleum refinery.

Section 5.10 states that effective on and after July 1, 2011, the operator of a flare subject to flare minimization requirements pursuant to Section 5.8 shall monitor the vent gas flow to the flare with a flow measuring device or other parameters as specified in the Permit to Operate. Section 5.10 is not effective till after July 1, 2011. The flare is not subject to the requirements of Section 5.8.

Section 5.11 states that effective on and after July 1, 2011, the operator of a petroleum refinery or a flare with a flaring capacity equal to or greater than 50 MMBtu/hr shall monitor the flare pursuant to Sections 6.6, 6.7, 6.8, 6.9, and 6.10. The flare is not part of petroleum refinery nor is the flaring capacity greater than 50 MMBtu/hr.

Compliance with the rule is expected.

**Rule 4409  COMPONENTS AT LIGHT CRUDE OIL PRODUCTION FACILITIES, NATURAL GAS PRODUCTION FACILITIES, AND NATURAL GAS PROCESSING FACILITIES**

The purpose of Rule 4409 is to limit VOC emissions from leaking components at light crude oil production facilities, natural gas production facilities and natural gas processing facilities. The rule establishes definitions for leaking components and requirements for inspection, identification, maintenance and repair of leaking components. Administrative and recordkeeping requirements are specified, including submission of an operator's management plan for each applicable facility.

The following condition will be on the ATC to ensure compliance with current requirements for light crude oil and natural gas production and processing facilities.

- The operator shall follow all applicable sections of District Rule 4409, Components at Light Crude Oil Production Facilities, Natural Gas Production Facilities, and Natural Gas Processing Facilities. [District Rule 4409]

**California Health & Safety Code 42301.6 (School Notice)**

The District has verified that this site is not located within 1,000 feet of a school. Therefore, pursuant to California Health and Safety Code 42301.6, a school notice is not required.
California Environmental Quality Act (CEQA)

CEQA requires each public agency to adopt objectives, criteria, and specific procedures consistent with CEQA Statutes and the CEQA Guidelines for administering its responsibilities under CEQA, including the orderly evaluation of projects and preparation of environmental documents. The District adopted its Environmental Review Guidelines (ERG) in 2001. The basic purposes of CEQA are to:

- Inform governmental decision-makers and the public about the potential, significant environmental effects of proposed activities;
- Identify the ways that environmental damage can be avoided or significantly reduced;
- Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible; and
- Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

Greenhouse Gas (GHG) Significance Determination

It is determined that no other agency has or will prepare an environmental review document for the project. Thus the District is the Lead Agency for this project. Project specific impacts on global climate change were evaluated consistent with the adopted District policy – Addressing GHG Emission Impacts for Stationary Source Projects Under CEQA When Serving as the Lead Agency. The District's engineering evaluation (this document) demonstrates that the project includes Best Performance Standards (BPS) for each class and category of greenhouse gas emissions unit (Appendix G). The District therefore concludes that the project would have a less than cumulatively significant impact on global climate change.

The District is the Lead Agency for this project because there is no other agency with broader statutory authority over this project. The District performed an Engineering Evaluation (this document) for the proposed project and determined that the activity will occur at an existing facility and the project involves negligible expansion of the existing use. Furthermore, the District determined that the activity will not have a significant effect on the environment. The District finds that the activity is categorically exempt from the provisions of CEQA pursuant to CEQA Guideline § 15031 (Existing Facilities), and finds that the project is exempt per the general rule that CEQA applies only to projects which have the potential for causing a significant effect on the environment (CEQA Guidelines §15061(b)(3)).

IX. Recommendation

Compliance with all applicable rules and regulations is expected. Pending a successful NSR Public Noticing period, issue the ATCs subject to the permit conditions on the attached draft ATC in Appendix H.

APPENDIX C

Quarterly Net Emissions Change
Quarterly Net Emissions Change (QNEC)

The Quarterly Net Emissions Change is used to complete the emission profile screen for the District’s PAS database. The QNEC shall be calculated as follows:

\[ \text{QNEC} = \text{PE2} - \text{PE1}, \text{ where:} \]

- \( \text{QNEC} \) = Quarterly Net Emissions Change for each emissions unit, lb/qtr.
- \( \text{PE2} \) = Post Project Potential to Emit for each emissions unit, lb/qtr.
- \( \text{PE1} \) = Pre-Project Potential to Emit for each emissions unit, lb/qtr.

Using the values in Sections VII.C.2 and VII.C.6 in the evaluation above, quarterly PE2 and quarterly PE1 can be calculated as follows:

\[ \text{PE2}_{\text{quarterly}} = \frac{\text{PE2}_{\text{annual}}}{4 \text{ quarters/year}} \]
\[ \text{PE1}_{\text{quarterly}} = \frac{\text{PE1}_{\text{annual}}}{4 \text{ quarters/year}} \]

BACT is the most stringent control technique for the emissions unit and class of source. Control techniques that are not achieved in practice or contained in a state implementation plan must be cost effective as well as feasible. Economic analysis to demonstrate cost effectiveness is required for all determinations that are not achieved in practice or contained in an EPA approved State Implementation Plan.

This Is a Summary Page for this Class of Source. For background information, see Permit Specific BACT Determinations on Details Page.

Top Down BACT Analysis for NOx and VOC Emissions:

Step 1 - Identify all control technologies

The SJVUAPCD BACT Clearinghouse guideline 1.4.2 (12/31/1998), identifies achieved in practice and technologically feasible BACT for “Waste Gas Flare – Incinerating Produced Gas” as follows:

1. Steam-assisted or air-assisted or Coanda effect burner when steam unavailable – achieved in practice

Step 2 - Eliminate Technologically Infeasible Options

The above listed technology is technologically feasible.

Step 3 - Rank Remaining Control Technologies by Control Effectiveness

1. Steam-assisted or air-assisted or Coanda effect burner when steam unavailable – achieved in practice

Step 4 - Cost Effectiveness Analysis

Only one control technology is identified and this technology is achieved in practice; therefore, a cost effectiveness analysis not necessary.

Step 5 - Select BACT for NOx and VOC

The use of Coanda effect burner when steam is unavailable is selected as BACT for NOx and VOC emissions.

Proposed Permit Conditions

To ensure that human health risks will not exceed District allowable levels; the following permit conditions must be included for:

Unit # 77-0

(1898) The exhaust stack shall vent vertically upward. The vertical exhaust flow shall not be impeded by a rain cap (flapper ok), roof overhang, or any other obstruction. [District Rule 4102] N

Waste gas/Natural gas usage shall not exceed 9.125 MMScf/yr [District Rule 2201] N

Unit S-2980-26 will be cancelled upon implementation of ATC for this project to be finalized.
B. RMR REPORT

I. Project Description
Technical Services received a revised request on July 31, 2012 to perform an Ambient Air Quality Analysis and a Risk Management Review for the use of a Waste Gas 2.29 mmBtu/hr flare.

II. Analysis
Technical Services performed a prioritization using the District's HEARTs database. Emissions were calculated using the Oilfield Natural Gas-Fired and Waste Gas Flare spreadsheet. In accordance with the District’s Risk Management Policy for Permitting New and Modified Sources (APR 1905, March 2, 2001), risks from the proposed unit's toxic emissions were prioritized using the procedure in the 1990 CAPCOA Facility Prioritization Guidelines and incorporated in the District's HEARTs database. The prioritization score for the facility was less than 1.0 (see RMR Summary Table), but the facility's total prioritization score exceeded 1.0. Therefore, a refined analysis was required and performed. AERMOD was used, with the parameters outlined below and concatenated meteorological data for Bakersfield 2005 to 2009 to determine the maximum dispersion factor at the nearest residential and business receptors. These dispersion factors were input into the HARP model to calculate the chronic and acute hazard indices and the carcinogenic risk for the project.

The following parameters were used for the review:

<table>
<thead>
<tr>
<th>Analysis Parameter (Unit 77)</th>
<th>940</th>
<th>Stack Direction</th>
<th>Vertical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Closest Receptor – Resident (m)</td>
<td></td>
<td></td>
<td></td>
</tr>

<td>0.265</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Gas Exit Velocity (m/sec)</td>
<td>0.297</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Technical Services also performed modeling for criteria pollutants CO, NOx, Sox, PM$_{10}$, and PM$_{2.5}$ as well as a RMR. The emission rates used for criteria pollutant modeling were

<table>

</tbody>
</table>

¹Results were taken from the attached PSD spreadsheet.
²The project was compared to the 1-hour NO₂ National Ambient Air Quality Standard that became effective on April 12, 2010 using the District's approved procedures. The criteria pollutant 1-hour value passed using TIER I NO₂ NAAQS modeling
³The project was compared to the 1-hour SO₂ National Ambient Air Quality Standard that became effective on August 23, 2010 using the District's approved procedures.
⁴The maximum predicted concentration for emissions of these criteria pollutants from the proposed unit are below EPA's level of significance as found in 40 CFR Part 51.165 (b)(2).

### III. Conclusion

The acute and chronic indices are below 1.0; and the cancer risk is 2.38E-06; which is greater than 1 in a million, but less than 10 in a million. In accordance with the District's Risk Management Policy, the project is approved with Toxic Best Available Control Technology (T-BACT) for VOCs.

To ensure that human health risks will not exceed District allowable levels; the permit conditions listed on page 1 of this report must be included for this proposed unit.

The emissions from the proposed equipment will not cause or contribute significantly to a violation of the State and National AAQS.

These conclusions are based on the data provided by the applicant and the project engineer. Therefore, this analysis is valid only as long as the proposed data and parameters do not change.

APPENDIX F

Compliance Certification
June 18, 2012

Mr. Leonard Scandura
Manager of Permit Services
San Joaquin Valley Unified APCD
34946 Flyover Court
Bakersfield, CA 93308

Subject: Project Number 1122041 - (S-2980) New 2.8 MMBTU/HR Flare Compliance Certification

Dear Mr. Scandura:

I hereby certify that all major Stationary Sources owned or operated by such person (or by any entity controlling, controlled by, or under common control with such person) in California, which are subject to emission limitations, are in compliance or on a schedule for compliance with all applicable emission limitations and standards.

Alternative siting analysis is required for any project, which constitutes a New Major Source or a Federal Major Modification.

The current project occurs at an existing facility. The applicant proposes to activate wells that will provide production capacity to existing operations at the site.

The project will provide production capacity to be used at the same location, the existing site will result in the least possible impact from the project.

Sincerely,

Bill Oliver
Operations Manager
APPENDIX G

Draft Authority to Construct
San Joaquin Valley
Air Pollution Control District

AUTHORITY TO CONSTRUCT

PERMIT NO: S-2980-77-0

LEGAL OWNER OR OPERATOR: SAN JOAQUIN FACILITIES MGMT
MAILING ADDRESS: 4520 CALIFORNIA AVENUE, SUITE 300
                  BAKERSFIELD, CA 93309

LOCATION: LIGHT OIL CENTRAL STATIONARY SOURCE
           CA

SECTION: SW10   TOWNSHIP: 29S   RANGE: 26E

EQUIPMENT DESCRIPTION:
2.29 MMBTU/HR COANDA-EFFECT FLARE WITH AUTO-IGNITION (ARCO LEASE)

CONDITIONS

1. A flame shall be present at all times when combustible gases are vented through the flare. [District Rule 4311]  

2. Flare outlet shall be equipped with an automatic ignition system, or, shall operate with a pilot flame present at all times when combustible gases are vented through the flare, except during purge periods for automatic-ignition equipped flares. [District Rule 4311]

3. If the flare uses a flow-sensing automatic ignition system and does not use a continuous flame pilot, the flare shall use purge gas for purging. [District Rule 4311]

4. No air contaminant shall be discharged into the atmosphere for a period or periods aggregating more than three minutes in any one hour which is as dark, as, or darker than, Ringlemann 1/4 or 5% opacity. [District Rule 2201]

5. (14) Particulate matter emissions shall not exceed 0.1 grains/dscf in concentration. [District Rule 4201]

6. Total quantity of produced/natural gascombusted in flare shall not exceed 9.125 MMscf/yr. [District Rule 4102]

7. Theexhaust stack shall vent vertically upward. The vertical exhaust flow shall not be impeded by a rain cap (flapper
   ok), roof overhang, or any other obstruction. [District Rule 4102]

8. Emission rates from flare shall not exceed any of the following: PM10: 0.008 lb/MMBtu, SOx (as SO2): 0.014
   lb/MMBtu, NOx (as NO2): 0.068 lb/MMBtu, VOC: 0.063 lb/MMBtu, CO: 0.37 lb/MMBtu. [District NSR Rule]

9. Sulfur content of produced gas combusted shall not exceed 5 gr/100 scf [District Rule 2201]

CONDITIONS CONTINUE ON NEXT PAGE

YOU MUST NOTIFY THE DISTRICT COMPLIANCE DIVISION AT (661) 392-5580 WHEN CONSTRUCTION IS COMPLETED AND PRIOR TO OPERATING THE EQUIPMENT OR MODIFICATIONS AUTHORIZED BY THIS AUTHORITY TO CONSTRUCT. This is NOT a PERMIT TO OPERATE. Approval or denial of a PERMIT TO OPERATE will be made after an inspection to verify that the equipment has been constructed in accordance with the approved plans, specifications and conditions of this Authority to Construct, and to determine if the equipment can be operated in compliance with all Rules and Regulations of the San Joaquin Valley Unified Air Pollution Control District. Unless construction has commenced pursuant to Rule 2650, this Authority to Construct shall expire and application shall be cancelled two years from the date of issuance. The applicant is responsible for complying with all laws, ordinances and regulations of all other governmental agencies which may pertain to the above equipment.

Seyed Sadreolin, Executive Director RPCO

DAVID WARNER, Director of Permit Services

Southern Regional Office • 34946 Flyover Court • Bakersfield, CA 93308 • (661) 392-5560 • Fax (661) 392-5585
10. Flare shall be equipped with operational produced gas volume flow meter. [District Rule 2201]

11. Measured heating value and quantity of flared gas shall be used to determine compliance with heat input limits. [District Rule 2201]

12. The operator shall follow all applicable sections of District Rule 4409, Components at Light Crude Oil Production Facilities, Natural Gas Production Facilities, and Natural Gas Processing Facilities. [District Rule 4409]

13. Higher heating value of flared gas shall be determined using ASTM D 1826 or D 1945 in conjunction with ASTM D 3588. [District Rules 1070 and 2201]

14. The flared gas sulfur concentration shall be determined annually using one of the following test methods: ASTM D1072, ASTM D3246, ASTM D6228 (GC-FPD), double GC for H2S and mercaptans, or equivalent test method with prior District approval. [District Rule 2201]

15. Permittee shall keep accurate daily and annual records of flared gas volumes, sulfur content, and higher heating value of flared gas and such records shall be retained for a period of 5 years and be made readily available for District inspection upon request. [District Rule 2201]

16. PTO S-2980-26 shall be canceled prior to or concurrently with the implementation of this ATC. [District Rule 2201]

BPS for VOC Control/Gas Disposal
San Joaquin Valley
Unified Air Pollution Control District

Best Performance Standard (BPS) x.x.xx

Date: 08/02/2011

<table>
<thead>
<tr>
<th>Class</th>
<th>VOC Control/Gas Disposal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Oil and Gas Production, Processing, and Refining</td>
</tr>
</tbody>
</table>

**Best Performance Standard (in order of recommendation)**

1) Incineration in existing engine, boiler, etc that creates useful work provided that equipment is available and practically capable of incinerating vapors (see equipment specific BPS for standards and requirements for new fired equipment) and currently burning fossil fuel; or,

- Transfer to Sales Gas Line – provided that access to sales gas line infrastructure is available; or,

- Re-injection to Formation – provided that access to a disposal well is available.

The following options supersede the BPS requirements above if: a) equipment listed above is not available; or, b) gas cannot safely be transferred to equipment listed above; or, c) used to control emergency gas releases.

2) Incineration in new Thermal Oxidizer – see equipment specific Thermal Oxidizer BPS for standards and requirements for new equipment; or,

- Incineration in New Flare with >98% TOC destruction efficiency, steam assist, air assist when steam is not available, or Coanda effect and equipped with non-continuous automatic electronic or ballistic ignition; or,

- Incineration in Existing Thermal Oxidizer or Flare
