Re: Proposed ATC / Certificate of Conformity (Significant Mod)
District Facility # N-1662
Project # N-1141107

Dear Ms. Bonardi:

Enclosed for your review is the District's analysis of an application for Authority to Construct for the facility identified above. You requested that a Certificate of Conformity with the procedural requirements of 40 CFR Part 70 be issued with this project. This project is for the modification of a glass furnace to rebuild and expand the furnace, to increase the furnace footprint, to increase the furnace throughput, to limit NOx emissions to 1.3 lb/ton of glass produced, to limit CO emissions to 0.2 lb/ton of glass produced, and to limit VOC emissions to 0.01 lb/ton of glass produced.

After addressing all comments made during the 30-day public notice and the 45-day EPA comment periods, the District intends to issue the Authority to Construct with a Certificate of Conformity. Please submit your comments within the 30-day public comment period, as specified in the enclosed public notice. Prior to operating with modifications authorized by the Authority to Construct, the facility must submit an application to modify the Title V permit as an administrative amendment, in accordance with District Rule 2520, Section 11.5.

If you have any questions, please contact Mr. Rupi Gill, Permit Services Manager, at (209) 557-6400.

Thank you for your cooperation in this matter.

Sincerely,

Arnaud Marjollet
Director of Permit Services

AM:JH/st

I. Proposal

This Authority to Construct project is for the modification of an existing glass furnace to rebrick the furnace, and to expand the furnace to allow a higher glass production rate. The following table compares the equipment specifications between the existing glass furnace and the proposed modified glass furnace.

<table>
<thead>

Title V

Gallo Glass Company has been issued a Title V permit. This modification can be classified as a Title V significant modification pursuant to Rule 2520, and can be processed with a Certificate of Conformity (COC). Since the facility has specifically requested that this project be processed in that manner, a 30-day public notice and a 45-day EPA comment period will be satisfied prior to the issuance of the Authority to Construct. Gallo Glass Company must apply to administratively amend their Title V permit.

III. Project Location

This equipment is located at 605 S Santa Cruz Ave in Modesto, CA and the District has confirmed that this equipment is not located within 1,000 feet of a K-12 School.

IV. Process Description

Gas Furnace #2 is a gas-oxygen fired furnace. The furnace is lined with refractory brick and contains molten glass. Mixed batch (sand, limestone, soda ash) and cullet (recycled glass) are fed from the batch plant and deposited upon the molten glass within the furnace, which has a typical glass bath depth of 73 inches. At the operating temperature of the furnace (2850 °F), soda ash and calcium carbonate decompose and release carbon dioxide (CO₂), which comprises about 15% by weight of the batch added to the furnace. The sodium sulfate in the blended batch acts as a refining agent. Sodium sulfate (Na₂SO₄) also decomposes and releases sulfur trioxide (SO₃). SO₃ is soluble in glass and tends to agglomerate small glass bubbles as it rises in the melt, thus removing gas bubbles that are considered an impurity in the glass. As the batch and cullet melt, the melt moves gravimetrically towards the front of the
Gallo Glass Company
N1662, 1141107

Melter and eventually flows through a throat leading to the glass refiner. Recovered dust from the electrostatic precipitator (ESP) or ceramic dust collector system may be used in conjunction with salt cake as a fining agent, as ESP dust is a functional representative for salt cake.

Currently, twelve natural gas-fired burners, ten rated at 7.5 MMBtu/hr each and two rated at 2.5 MMBtu/hr each, provide the furnace with up to 80 MMBtu/hr of radiant heat input capacity to maintain the furnace operating temperature. A gas-oxygen furnace uses oxygen, rather than ambient air, as the oxidizer, which reduces thermal NOx formation and results in more complete combustion thus also minimizing CO and VOC emissions. Eighteen 3-inch diameter boost electrodes powered by three 1,166 kVA single phase transformers (3,498 kVA of electric boost) provide heat to the lower regions of the glass bath that are not directly heated by the gas-oxygen burners. The furnace is equipped with one side exhaust port. Exhaust from the furnace is discharged into a common header shared by three other gas-oxygen furnaces. The combined exhaust passes through an electrostatic precipitator equipped with a lime scrubber, which removes SO₃ and filterable PM. The main stack is also equipped with parallel ceramic dust filter dust collector that treats a slip stream of the exhaust gas while the ESP treats the majority of the main exhaust gas. The main stack discharges the combined furnace exhaust to the atmosphere.

The four walls of Glass Furnace #2 will be widened and the furnace walls will be rebricked. These modifications will increase the footprint of the glass furnace #2 from 836 ft² to 1,425 ft². The glass bath depth will also be increased to 80 inches. The two 2.5 MMBtu/hr burners will be removed from service while the ten existing 7.5 MMBtu/hr burners will be retained. The eighteen 3-inch diameter electric boost electrodes will be replaced with eighteen 2.5-inch diameter boost electrodes and eight additional barrier boost electrodes powered by a new transformer. The modified glass furnace #2 will provide 2,700 kW of electric boost to further heat the submerged melt. The operating temperature will be increased to 2,875 °F. The alterations are being implemented to increase the glass production capacity, extend furnace life, and improve energy efficiency. The glass production will increase from 352.1 tons per day to 430 tons per day.

Operating Schedule:

This furnace is expected to operate 24 hours/day, 365 days/year.
V. Equipment Listing

**Pre-Project Equipment Description:**

N-1662-2-16: GLASS FURNACE #2 WITH 10 MAXON GAS/OXYGEN BURNERS AND 2 AIR PRODUCTS CLEANFIRE GEN1 GAS/OXYGEN BURNERS AND ASSOCIATED FORMING EQUIPMENT (80 MMBTU/HR MAX HEAT CAPACITY). THIS FURNACE IS DUCTED THROUGH A STACK COMMON TO PERMIT UNITS N-1662-1, N-1662-2, N-1662-3 AND N-1662-4. THE FURNACES ARE SERVED BY A SHARED SOX SCRUBBER AND AN ELECTROSTATIC PRECIPITATOR AND/OR A TRI-MER UTF460 CERAMIC FILTER TYPE DUST COLLECTOR.

**Post-Project Equipment Description:**

N-1662-2-17: GLASS FURNACE #2 WITH 10 MAXON GAS/OXYGEN BURNERS (OR EQUIVALENT) AND ASSOCIATED FORMING EQUIPMENT (75 MMBTU/HR MAX HEAT CAPACITY). THIS FURNACE IS DUCTED THROUGH A STACK COMMON TO PERMIT UNITS N-1662-1, N-1662-2, N-1662-3 AND N-1662-4. THE FURNACES ARE SERVED BY A SHARED SOX SCRUBBER AND AN ELECTROSTATIC PRECIPITATOR AND/OR A TRI-MER UTF460 CERAMIC FILTER TYPE DUST COLLECTOR, AND A FURNACE CHARGING AREA SERVED BY TWO DUST COLLECTORS.

VI. Emission Control Technology Evaluation

The furnace is equipped with emission control technology for NOx, SOx and PM10. NOx is controlled utilizing oxy-fuel firing, SOx is controlled utilizing a shared scrubber and PM10 is controlled utilizing a shared electrostatic precipitator (ESP) and/or a shared ceramic filter type dust collector. The shared control devices are shared with Glass Furnaces #1, #3, and #4.

**Oxy-Fuel Firing:**

Oxy-fuel firing is utilized to control NOx emissions. In oxy-fuel firing, oxygen is generated and replaces air in the combustion process. The absence of nitrogen containing combustion air inhibits the formation of thermal NOx.

**Shared SOx Scrubber:**

Gallo Glass utilizes a scrubber for SOx control followed by an Electrostatic Precipitator (ESP) for SOx/particulate matter control.

From the furnace, the SOx contaminated airstream travels through a scrubber. Inside of the scrubber, SOx is absorbed by a reagent (lime, trona, etc.), which exits the scrubber in the form of particulate matter. The contaminated airstream (sulfur contaminated scrubber reagent and the particulate matter generated in the furnace) then enters the ESP. The ESP causes the influent particulate matter to be charged and captured on oppositely charged plates.

---

1 The pre-project equipment description has been corrected here to include the existing 2.5 MMBtu/hr gas/oxygen burners.
**Shared Electrostatic Precipitator:**

An electrostatic precipitator (ESP) is utilized to control the particulate matter emissions generated in the glass melting process and from the SOx scrubber. The contaminated air stream is passed through positively or negatively charged electrodes that place a charge on the particulate matter. The contaminated air stream, including the charged particles, is then passed through oppositely charged electrodes that attract and collect the particulate matter.

**Shared Ceramic Filter Type Dust Collector:**

The dust collector operates like a traditional fabric filter type baghouse but utilizes ceramic filters that will provide a reliably high filtering efficiency at high temperatures. The unit utilizes reverse pulse air type cartridge cleaning.

**Batch Charging Dust Collectors:**

PM$_{10}$ emissions from the batch charging equipment will be controlled using dust collectors. A PM$_{10}$ filter efficiency of 99% is typical for dust collection systems.

**VII. General Calculations**

**A. Assumptions**

- The glass furnace operates 24 hours/day, 365 days/year.
- PM10 emissions from the batch charging equipment served by the dust collectors is negligible.$^2$
- All other assumptions will be stated as they are made.

**B. Emission Factors**

1. **Pre-Project Emission Factors**

The following table lists the pre-project emission factors for the glass furnace:

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Pre-Project Emission Factors (EF1) and/or Emission Rates</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO$_x$</td>
<td>1.4 lb/ton of glass produced (rolling 30-day average)</td>
<td>PTO N-1662-2-16</td>
</tr>
<tr>
<td>SO$_x$</td>
<td>0.99 lb/ton of glass produced (rolling 30-day average)</td>
<td>PTO N-1662-2-16</td>
</tr>
<tr>
<td></td>
<td>When producing glass that is less than 25% mixed color cullet by weight</td>
<td></td>
</tr>
<tr>
<td>PM$_{10}$</td>
<td>0.81 lb/ton of glass produced (rolling 30-day average)</td>
<td>PTO N-1662-2-16</td>
</tr>
<tr>
<td></td>
<td>Normal Operation: 0.45 lb/ton of glass produced</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Emission Bypass Periods: 0.71 lb/ton of glass produced</td>
<td></td>
</tr>
<tr>
<td>CO</td>
<td>0.9 lb/ton of glass produced</td>
<td>PTO N-1662-2-16</td>
</tr>
<tr>
<td>VOC</td>
<td>0.23 lb/ton of glass produced</td>
<td>PTO N-1662-2-16</td>
</tr>
</tbody>
</table>

$^2$ Per AP-42 table 11.15-1, batch emissions from within the furnace are negligible when served by a control device.
2. Post-Project Emission Factors

The following table lists the post-project emission factors for the glass furnace. Emission factors that have changed are in bold italic font.

<table>
<thead>
<tr>

C. Calculations

1. Pre-Project Potential to Emit (PE1)

The following summary of the pre-project emissions for the glass furnace was obtained from the application review for District Project N-1122842.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Daily Emissions (lb/day)</th>
<th>Annual Emissions (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO&lt;sub&gt;x&lt;/sub&gt;</td>
<td>492.9</td>
<td>179,923</td>
</tr>
<tr>
<td>SO&lt;sub&gt;x&lt;/sub&gt;</td>
<td>348.6</td>
<td>127,231</td>
</tr>
<tr>
<td>PM&lt;sub&gt;10&lt;/sub&gt;</td>
<td>250.0</td>
<td>58,382</td>
</tr>
<tr>
<td>CO</td>
<td>316.9</td>
<td>115,665</td>
</tr>
<tr>
<td>VOC</td>
<td>81.0</td>
<td>29,559</td>
</tr>
</tbody>
</table>

2. Post Project Potential to Emit (PE2)

**NO<sub>x</sub> Emissions**

Daily post-project NO<sub>x</sub> emissions are based on the quantity of glass pulled (430 tons/day) and the post-project emission factor for NO<sub>x</sub> (1.3 lb-NO<sub>x</sub>/ton).

PE2 NO<sub>x</sub> = 430 tons/day x 1.3 lb-NO<sub>x</sub>/ton = 559.0 lb-NO<sub>x</sub>/day

Annual post-project NO<sub>x</sub> emissions are based on the quantity of glass pulled (156,950 tons/year) and the post-project emission factor for NO<sub>x</sub> (1.3 lb-NO<sub>x</sub>/ton).

PE2 NO<sub>x</sub> = 156,950 tons/year x 1.3 lb-NO<sub>x</sub>/ton = 204,035 lb-NO<sub>x</sub>/year
SOx Emissions

Daily worst-case post-project SOx emissions are based on the quantity of glass pulled (430 tons/day) and the highest post-project emission factor for SOx (0.99 lb-SOx/ton).

PE2 SOx = 430 tons/day x 0.99 lb-SOx/ton = 425.7 lb-SOx/day

Annual post-project SOx emissions are based on the quantity of glass pulled (156,950 tons/year) and the highest post-project emission factor for SOx (0.99 lb-SOx/ton).

PE2 SOx = 156,950 tons/year x 0.99 lb-SOx/ton = 155,381 lb-SOx/year

PM10 Emissions

Daily worst-case post-project PM10 emissions occur when operating in bypass mode. Thus, daily PM10 emissions are based on the quantity of glass pulled (430 tons/day) and the bypass mode post-project emission factor for PM10 (0.71 lb-PM10/ton).

PE2 PM10 = 430 tons/day x 0.71 lb-PM10/ton = 305.3 lb-PM10/day

Annually, the unit may operate 6 full days in bypass mode. Thus, annual post-project PM10 emissions are based on the quantity of glass pulled (430 tons/day) with 6 days of operation at the bypass mode post-project emission rate for PM10 (0.71 lb-PM10/ton), and 359 days of normal operation at the normal post-project emission rate for PM10 (0.45 lb/ton)

PE PM10 = 430 tons/day x 6 days/year x 0.71 lb-PM10/ton
+ 430 tons/day x 359 days/year x 0.45 lb-PM10/ton

PE PM10 = 71,298 lb/year

PM2.5 Emissions

PM2.5 emissions comprise 71% of the controlled PM10 emissions, and 96% of the uncontrolled PM10 emissions, based on the glass furnace particle size distribution data from AP-42 Table 11.15-3 (1/95). Thus,

Worst-case daily PM2.5 emissions occur when the unit is in bypass mode. Thus,

PE PM2.5 = 305.3 lb-PM10/day x 0.96 lb-PM2.5/lb-PM10 = 293.1 lb-PM2.5/day

Worst-case annual PM2.5 emissions are based on the PM10 emission calculations and the above PM2.5 percentages for controlled and uncontrolled operations.

PE PM2.5 = 430 tons/day x 6 days/year x 0.71 lb-PM10/ton x 0.96 lb-PM2.5/lb-PM10
+ 430 tons/day x 359 days/year x 0.45 lb-PM10/ton x 0.71 lb-PM2.5/lb-PM10

PE PM2.5 = 51,080 lb-PM2.5/year
CO Emissions

Daily post-project CO emissions are based on the quantity of glass pulled (430 tons/day) and the post-project emission factor for CO (0.2 lb-CO/ton).

PE2 CO = 430 tons/day x 0.2 lb-CO/ton = 86.0 lb-CO/day

Annual post-project CO emissions are based on the quantity of glass pulled (156,950 tons/year) and the post-project emission factor for CO (0.2 lb-CO/ton).

PE2 CO = 156,950 tons/year x 0.2 lb-CO/ton = 31,390 lb-CO/year

VOC Emissions

Daily post-project VOC emissions are based on the quantity of glass pulled (430 tons/day) and the post-project emission factor for VOC (0.01 lb-VOC/ton).

PE2 VOC = 430 tons/day x 0.01 lb-VOC/ton = 4.3 lb-VOC/day

Annual post-project VOC emissions are based on the quantity of glass pulled (156,950 tons/year) and the post-project emission factor for VOC (0.01 lb-VOC/ton).

PE2 VOC = 156,950 tons/year x 0.01 lb-VOC/ton = 1,570 lb-VOC/year

Post-Project Emissions Summary

3. Pre-Project Stationary Source Potential to Emit (SSPE1)

Pursuant to Section 4.9 of District Rule 2201, the Pre-Project Stationary Source Potential to Emit (SSPE1) is the Potential to Emit (PE) from all units with valid ATCs or PTOs at the Stationary Source and the quantity of Emission Reduction Credits (ERCs) which have been banked since September 19, 1991 for Actual Emissions Reductions that have occurred at the source, and which have not been used on-site. Unless otherwise noted, the SSPE data in the following table was obtained from the application review for District Project N-1141138.

4. Post Project Stationary Source Potential to Emit (SSPE2)

Pursuant to Section 4.10 of District Rule 2201, the Post Project Stationary Source Potential to Emit (SSPE2) is the Potential to Emit (PE) from all units with valid Authorities to Construct (ATC) or Permits to Operate (PTO) at the Stationary Source and the quantity of emission reduction credits (ERC) which have been banked since September 19, 1991 for Actual Emissions Reductions that have occurred at the source, and which have not been used on-site.

### 5. Major Source Determination

#### District Rule 2201 Major Source Determination

Pursuant to Section 3.24 of District Rule 2201, a Major Source is a stationary source with post-project emissions or a Post Project Stationary Source Potential to Emit (SSPE2), equal to or exceeding one or more of the following threshold values. However, Section 3.24.2 states, "for the purposes of determining major source status, the SSPE2 shall not include the quantity of emission reduction credits (ERC) which have been banked since September 19, 1991 for Actual Emissions Reductions that have occurred at the source, and which have not been used on-site."

<table>
<thead>
<tr>

<td>129,912</td>
<td>20,000</td>
<td>Yes</td>
</tr>
</tbody>
</table>
As shown in the previous table, this facility is a Major Source for NOx, SOx, PM10, PM2.5, and VOC emissions.

**District Rule 2410 Major Source Determination:**

The facility or the equipment evaluated under this project is not listed as one of the categories specified in 40 CFR 52.21 (b)(1)(i). Therefore the following PSD Major Source thresholds are applicable.

<table>
<thead>
<tr>
<th>PSD Major Source Determination (tons/year)</th>
<th>NO\textsubscript{2}</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facility PE before Project</td>
<td>473.9</td>
</tr>
<tr>
<td>PSD Major Source Thresholds</td>
<td>250</td>
</tr>
<tr>
<td>PSD Major Source ? (Y/N)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

As shown above, the facility is an existing Major Source for PSD since NO\textsubscript{2} emissions are greater than the PSD Major Source Threshold.

### 6. District Baseline Emissions (BE)

BE = Pre-project Potential to Emit for:

- Any unit located at a non-Major Source,
- Any Highly-Utilized Emissions Unit, located at a Major Source,
- Any Fully-Offset Emissions Unit, located at a Major Source, or
- Any Clean Emissions Unit, located at a Major Source.

The facility is a non-major source for CO emissions. Therefore, BE for CO emissions are equal to the pre-project potential to emit.

**Clean Unit Determination**

BACT Guideline 1.5.9 is applicable to container glass production furnaces. The following table compares the BACT requirement and the pre-project emission limits. The determination will follow District rounding policies.
Gallo Glass Company
N1662, 1141107

<td>0.2 lb/ton</td>
<td>0.2 lb/ton</td>
<td>Yes*</td>
</tr>
</tbody>
</table>

* The District uses conventional rounding rules for determining compliance with emission limits. For SOx and VOC emissions, the current furnace emission limits contain more significant digits than the Achieved in Practice BACT limits from the BACT Guideline. Per conventional rounding procedures, the current emission limits have been rounded to 0.8 lb-SOx/ton and 0.2 lb-VOC/ton, to match the significant digits of the BACT limits. After rounding, the current furnace limits were determined to be in compliance with the BACT limits; therefore, the unit is clean for SOx and VOC.

Since the unit is clean for these pollutants, BE is equal to the pre-project potential to emit for these units.

### 7. SB288 Modification

An SB 288 Major Modification is defined in 40 CFR Part 51.165 (in effect 12/19/02) as "any physical change in or change in the method of operation of a major stationary source that would result in a significant net emissions increase of any pollutant subject to regulation under the Act."

This facility is a Major Source for NOx, SOx, PM10, PM2.5, and VOC emissions. There is no SB288 Major Modification threshold for PM2.5 emissions; therefore, an SB288 Modification cannot be triggered for PM2.5.

SB288 calculations are required for NOx, SOx, PM10, and VOC, to determine whether this project will trigger an SB288 Modification. A project triggers an SB288 Modification if the net emissions increase (NEI) exceeds the thresholds in District Rule 2201. The respective thresholds are 50,000 lb-NOx/year, 80,000 lb-SOx/year, 30,000 lb-PM10/year and 50,000 lb-VOC/year.

For existing units, NEI is equal to PE2 – BAE, where:

BAE = Baseline average annual emissions over a representative 2-years of operation.

---

3 The SOx emission limit in BACT Guideline 1.5.9 only applies when the mixed color cullet is less than 25% of the total cullet. It was determined in District Project N-1120773 that the Achieved in Practice BACT level for SOx is 1.1 lb/ton when the mixed color cullet is equal to or greater than 25% of the total cullet.
NOx:
The Baseline Average Emissions for NOx were determined in Appendix III to be 92,014 lb-NOx/year. PE2 was determined earlier in this evaluation.

\[ \text{NEI} = \text{PE2} - \text{BAE} = 204,035 \text{ lb-NOx/year} - 92,014 \text{ lb-NOx/year} \]
\[ \text{NEI} = 112,021 \text{ lb-NOx/year} \]

Since the NEI for NOx is greater than the SB288 threshold of 50,000 lb-NOx/year, an SB288 modification is triggered for NOx emissions.

SOx:
The Baseline Average Emissions for SOx were determined in Appendix III to be 84,631 lb-SOx/year. PE2 was determined earlier in this evaluation.

\[ \text{NEI} = \text{PE2} - \text{BAE} = 155,381 \text{ lb-SOx/year} - 84,631 \text{ lb-SOx/year} \]
\[ \text{NEI} = 70,750 \text{ lb-SOx/year} \]

Since the NEI for SOx is less than the SB288 modification threshold of 80,000 lb-SOx/year, an SB288 Modification is not triggered for SOx emissions.

PM\textsubscript{10}:
The Baseline Average Emissions for PM\textsubscript{10} were determined in Appendix III to be 13,140 lb-PM\textsubscript{10}/year. PE2 was determined earlier in this evaluation.

\[ \text{NEI} = \text{PE2} - \text{BAE} = 71,298 \text{ lb-PM}_{10}/\text{year} - 13,140 \text{ lb-PM}_{10}/\text{year} \]
\[ \text{NEI} = 58,158 \text{ lb-PM}_{10}/\text{year} \]

Since the NEI for PM\textsubscript{10} is greater than the SB288 threshold of 30,000 lb-PM\textsubscript{10}/year, an SB288 modification is triggered for PM\textsubscript{10} emissions.

VOC:
The Baseline Average Emissions for VOC were determined in Appendix III to be 474 lb-VOC/year. PE2 was determined earlier in this evaluation.

\[ \text{NEI} = \text{PE2} - \text{BAE} = 1,570 \text{ lb-VOC/year} - 474 \text{ lb-VOC/year} \]
\[ \text{NEI} = 1,096 \]

Since the NEI for VOC is less than the SB288 modification threshold of 50,000 lb-VOC/year, an SB288 Modification is not triggered for VOC emissions.

Summary
An SB288 Modification is triggered for NOx and PM\textsubscript{10} emissions.
8. Federal Major Modification

District Rule 2201, Section 3.17 states that Federal Major Modifications are the same as "Major Modification" as defined in 40 CFR 51.165 and part D of Title I of the CAA.

This facility is a Major Source for NOx, SOx, PM10, PM2.5, and VOC emissions. Therefore, Federal Major Modification calculations are required for these pollutants to determine whether this project will trigger an SB288 Modification. A project triggers a Federal Major Modification if the net emissions increase (NEI) exceeds the thresholds in the following table:

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Federal Major Modification Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td>0 lb/year</td>
</tr>
<tr>
<td>SOx</td>
<td>80,000 lb/year</td>
</tr>
<tr>
<td>PM10</td>
<td>30,000 lb/year</td>
</tr>
<tr>
<td>PM2.5</td>
<td>20,000 lb-direct PM2.5/year or 80,000 lb-SOx/year or 80,000 lb-NOx/year</td>
</tr>
<tr>
<td>VOC</td>
<td>0 lb/year</td>
</tr>
</tbody>
</table>

The NEI is calculated as follows:

\[ \text{NEI} = \text{PAE} - \text{BAE} \]

Where,

\[ \text{PAE} = \text{Projected Actual Emissions} \]
\[ \text{BAE} = \text{Baseline Average Emissions (any 24-month period within last 10 years)} \]

**NOx**

For NOx the facility has chosen a baseline period of June 2007 through May 2009. Based on CEMs data during that period, the average annual baseline NOx emissions were 108,600 lb-NOx/year. For the NOx baseline period, the average annual glass production was 116,800 tons/year. The average emission rate for the NOx baseline period was 0.93 lb/ton, well below the 1.4 lb-NOx/ton emission limit from the permit.

For the 10 years following the modification to the furnace, the facility projects that the actual emissions will be no more than 60% greater than the baseline actual emissions from the furnace. Thus,

\[ \text{PAE} = 1.6 \times \text{BAE} = 1.6 \times 108,600 \text{ lb-NOx/year} = 173,760 \text{ lb-NOx/year} \]

\[ \text{NEI} = \text{PAE} - \text{BAE} = 173,760 \text{ lb-NOx/year} - 108,600 \text{ lb-NOx/year} \]
\[ \text{NEI} = 65,160 \text{ lb-NOx/year} \]
The proposed changes to furnace #2 will not debottleneck any other NOx emitting units at the facility. Since the NEI for NOx is greater than the Federal Major Modification threshold of 0 lb-NOx/year, this project is a Federal Major Modification for NOx emissions.

SOx

For SOx the facility has chosen a baseline period of June 2008 through May 2010. Based on CEMs data during that period, the average annual baseline SOx emissions were 130,800 lb-SOx/year. For the SOx baseline period, the average annual glass production was 113,483 tons/year. The average emission rate for the SOx baseline period was 1.15 lb/ton, which is greater than the currently applicable emission rates on the permit. Thus, the baseline emissions will be adjusted, using a 0.81 lb-SOx/ton emission factor to determine the most conservative adjusted baseline emission rate.

\[
BAE = 113,483 \text{ tons/year} \times 0.81 \text{ lb-SOx/ton} \\
BAE = 91,921 \text{ lb-SOx/year}
\]

For the 10 years following the modification to the furnace, the facility projects that the actual emissions will be no more than 60% greater than the baseline actual emissions from the furnace. Thus,

\[
PAE = 1.6 \times BAE = 1.6 \times 91,921 \text{ lb-SOx/year} = 147,074 \text{ lb-SOx/year}
\]

\[
NEI = PAE - BAE = 147,074 \text{ lb-SOx/year} - 91,921 \text{ lb-SOx/year} \\
NEI = 55,153 \text{ lb-SOx/year}
\]

The proposed changes to furnace #2 will not debottleneck any other SOx emitting units at the facility. Since the NEI for SOx is less than the Federal Major Modification threshold of 80,000 lb-SOx/year, this project is not a Federal Major Modification for SOx emissions. The facility is proposing to meet BACT requirements for SOx and will conduct a public notice. Therefore, all the potential requirements of triggering a Federal Major Modification for SOx have already been satisfied, and 10-year recordkeeping will not be required to demonstrate that SOx emissions are not triggering a Federal Major Modification.

PM10

For PM10 emissions, the facility has chosen a baseline period of April 2008 through March 2010. Based on source test data during that period, the average annual baseline PM10 emissions were 20,800 lb-PM10/year. For the PM10 baseline period, the average annual glass production was 113,638 tons/year. The average emission rate for the PM10 baseline period was 0.18 lb/ton, well below the 0.45 lb-PM10/ton emission limit from the current permit.

For the 10 years following the modification to the furnace, the facility projects that the actual emissions will be no more than 60% greater than the baseline actual emissions from the furnace. Thus,
PAE_{furnace} = 1.6 \times BAPE_{furnace} = 1.6 \times 20,400 \text{ lb-PM10/year} = 32,640 \text{ lb-PM10/year}

NEI_{furnace} = PAE_{furnace} - BAPE_{furnace} = 32,640 \text{ lb-PM10/year} - 20,800 \text{ lb-PM10/year}
NEI_{furnace} = 11,840 \text{ lb-PM10/year}

Additionally, the increase in the glass production limit for furnace #2 will debottleneck the batch plant that supplies batch material to the furnace. Based on historical data for the Gallo furnaces, the batch plant must supply 1.11 tons of batch for each ton of glass produced in the furnaces. Thus, the baseline batch input rate was:

Baseline Batch = 113,638 \text{ tons-glass/year} \times 1.11 \text{ tons-batch/tons glass}
Baseline Batch = 126,138 \text{ tons-batch/year}

Per District Project N-1141138, the potential annual emissions from the batching operation are 49,618 lb-PM10/year for an annual throughput of 893,520 tons-batch/year. Thus, the emission factor for the batching operation is:

EF_{batching} = \frac{49,618 \text{ lb-PM10/year}}{893,520 \text{ tons-batch/year}} = 0.056 \text{ lb-PM10/ton-batch}

Using this emission factor and the baseline batch throughput, the baseline average emissions for the batching operation is:

BAE_{batch} = 126,138 \text{ tons-batch/year} \times 0.056 \text{ lb-PM10/ton-batch}
BAE_{batch} = 7,064 \text{ lb-PM10/year}

The projected actual emissions for the batching operation will be calculated based on the previously discussed assumption that, at most, the facility projects there might be a 60% increase in emissions for the 10 years following the modification of the furnace. Thus,

PAE_{batch} = BAE_{batch} \times 1.6 = 7,064 \text{ lb-PM10/year} \times 1.6 = 11,302 \text{ lb-PM10/year}

NEI_{batch} = PAE_{batch} - BAE_{batch} = 11,302 \text{ lb-PM10/year} - 7,064 \text{ lb-PM10/year}
NEI_{batch} = 4,238 \text{ lb-PM10/year}

The total NEI is equal to the sum of the NEI for the glass furnace and the NEI for the debottlenecked batching operation. Thus,

NEI_{total} = NEI_{furnace} + NEI_{batch} = 11,840 \text{ lb-PM10/year} + 4,238 \text{ lb-PM10/year}
NEI_{total} = 16,078 \text{ lb-PM10/year}
Since the NEI_{total} for PM10 is less than the Federal Major Modification threshold of 30,000 lb-PM10/year, this project is not a Federal Major Modification for PM10 emissions. The facility is proposing to meet BACT requirements for PM10 and will conduct a public notice. Therefore, all the potential requirements of triggering a Federal Major Modification for PM10 have already been satisfied, and 10-year recordkeeping will not be required to demonstrate that PM10 emissions are not triggering a Federal Major Modification.

**PM2.5**

The PM2.5 baseline period is identical to the PM10 baseline period. Since PM2.5 is a subset of PM10 emissions, the NEI for PM2.5 is less than or equal to the NEI for PM10. Additionally, a Federal Major Modification for PM2.5 includes a threshold of 80,000 lb-NOx/year and 80,000 lb-SOx/year.

\[
\text{NEI}_{\text{Direct PM2.5}} \leq \text{NEI}_{\text{PM10}} \leq 16,078 \text{ lb/year}
\]

\[
\text{NEI}_{\text{NOx}} = 65,160 \text{ lb-NOx/year}
\]

\[
\text{NEI}_{\text{SOx}} = 55,153 \text{ lb-SOx/year}
\]

Since the NEI are less than the PM2.5 Federal Major Modification thresholds of 20,000 lb-PM2.5/year, 80,000 lb-NOx/year, and 55,153 lb-SOx/year, this project is not a Federal Major Modification for PM2.5. The facility is proposing to meet BACT requirements for particulate matter and will conduct a public notice. Therefore, all the potential requirements of triggering a Federal Major Modification for PM2.5 have already been satisfied, and 10-year recordkeeping will not be required to demonstrate that PM2.5 emissions are not triggering a Federal Major Modification.

**VOC**

The same baseline period for VOC, as used in SB288 Major Modification Calculations, will be used. Therefore, BAE is equal to:

\[
\text{BAE} = 474 \text{ lb-VOC/year}
\]

For VOC emissions, NEI will be calculated as PE2 - BAE.

\[
\text{PE2} = 1,570 \text{ lb-VOC/year}
\]

\[
\text{NEI} = \text{PE2} - \text{BAE} = 1,570 \text{ lb-VOC/year} - 474 \text{ lb-VOC/year}
\]

\[
\text{NEI} = 1,096 \text{ lb-VOC/year}
\]

Since the NEI for VOC is greater than the Federal Major Modification threshold of 0 lb-VOC/year, this project is a Federal Major Modification for VOC emissions.

**Summary**

A Federal Major Modification is triggered for NOx and VOC emissions.
9. Rule 2410 – Prevention of Significant Deterioration (PSD) Applicability Determination

Rule 2410 applies to pollutants for which the District is in attainment or for unclassified pollutants. The pollutants addressed in the PSD applicability determination are listed as follows:

- NO2 (as a primary pollutant)
- SO2 (as a primary pollutant)
- CO
- PM
- PM10
- Greenhouse gases (GHG): CO2, N2O, CH4, HFCs, PFCs, and SF6

The first step of this PSD evaluation consists of determining whether the facility is an existing PSD Major Source or not (See Section VII.C.5 of this document).

In the case the facility is an existing PSD Major Source, the second step of the PSD evaluation is to determine if the project results in a PSD significant increase.

I. Project Location Relative to Class 1 Area

As demonstrated in the “PSD Major Source Determination” Section above, the facility was determined to be a existing major source for PSD. Because the project is not located within 10 km of a Class 1 area – modeling of the emission increase is not required to determine if the project is subject to the requirements of Rule 2410.

II. Significance of Project Emission Increase Determination

a. Potential to Emit of attainment/unclassified pollutant for New or Modified Emission Units vs PSD Significant Emission Increase Thresholds

As a screening tool, the potential to emit from all new and modified units is compared to the PSD significant emission increase thresholds, and if total potential to emit from all new and modified units is below this threshold, no further analysis will be needed.
As demonstrated above, because the project has a total potential to emit from all new and modified emission units greater than PSD significant emission increase thresholds for NO₂, SO₂, PM, and PM10, further analysis is required for NO₂, SO₂, PM, and PM10 to determine if the project has an emission increase greater than the PSD significant emission increase thresholds for those pollutants.

b. Emission Increase for Each Attainment/Unclassified Pollutant with a Significant Emission Increase vs PSD Significant Emission Increase Thresholds

In this step, the emission increase for each remaining attainment/unclassified pollutant is compared to the PSD significant emission increase thresholds, and if emission increase for each attainment pollutant is below this threshold, no further analysis is needed.

The method to calculate the NEI is identical to the method used for determining the NEI in the Federal Major Modification Calculations shown earlier in this evaluation.

NO₂

The NEI for NO₂ is identical to the NEI calculated for NOx in the Federal Major Modification section of this evaluation. Thus,

\[
\text{NEI} = 65,160 \text{ lb-NO}_2/\text{year} = 32.6 \text{ tons-NO}_2 \text{ year}
\]

---

4 The PM and PM10 emission rates in this table do not include PM and PM10 emissions from the debottlenecked batch plant.

5 Pursuant to AP-42 Table 11.15-3, 75% of PM emissions are PM10 emissions for a furnace controlled by an electrostatic precipitator. PM emissions are therefore equal to:

\[
\begin{align*}
\text{PE PM} &= \text{PE PM10} + 0.75 \\
\text{PE PM} &= 35.6 \text{ tons-PM10/year} + 0.75 \\
\text{PE PM} &= 47.5 \text{ tons-PM/year}
\end{align*}
\]

6 The facility supplied a projected actual emission (PAE) rate of 52,019 lb-CO₂e/year. Since the net emission increase is calculated as NEI = PAE - BAE, the NEI cannot exceed 52,019 lb-CO₂e/year; thus, the project cannot exceed the PSD Significant Emission Increase Threshold of 75,000 tons/year.
Since the NEI for NO\textsubscript{2} is less than the PSD significant emission increase threshold of 40 tons-NO\textsubscript{2}/year, the project does not trigger PSD for NO\textsubscript{2}. A 10-year NO\textsubscript{2} recordkeeping requirement will be included on the permit to ensure that PSD is not triggered following the modifications to the glass furnace.

SO\textsubscript{2}

The NEI for SO\textsubscript{2} is identical to the NEI calculated for SO\textsubscript{x} in the Federal Major Modification section of this evaluation. Thus,

\[ \text{NEI} = 55,153 \text{ lb-SO}_2/\text{year} = 27.6 \text{ tons-SO}_2/\text{year} \]

Since the NEI for SO\textsubscript{2} is less than the PSD significant emission increase threshold of 40 tons-SO\textsubscript{2}/year, the project does not trigger PSD for SO\textsubscript{2}. Furthermore, even when the NEI is calculated as PE\textsubscript{2} – BAE, the 40 ton significant threshold is not triggered. Therefore, recordkeeping for SO\textsubscript{x} emissions will not be required to demonstrate that PSD will not be triggered following the modifications to the glass furnace.

PM\textsubscript{10}

The NEI for PM\textsubscript{10} is identical to the NEI calculated for PM\textsubscript{10} in the Federal Major Modification section of this evaluation. Thus,

\[ \text{NEI}_{\text{total}} = 16,078 \text{ lb-PM}\textsubscript{10}/\text{year} = 8.0 \text{ tons-PM}\textsubscript{10}/\text{year} \]

Since the NEI for PM\textsubscript{10} is less than the PSD significant emission increase threshold of 15 tons-PM\textsubscript{10}/year, the project does not trigger PSD for PM\textsubscript{10}. A 10-year PM\textsubscript{10} recordkeeping requirement will be included on the permit to ensure that PSD is not triggered following the modifications to the glass furnace.

PM

The NEI for PM will be calculated, based on the PM\textsubscript{10} NEI and the PM\textsubscript{10} fractions. The NEI for PM\textsubscript{10} is equal to the NEI from the furnace for PM\textsubscript{10} and NEI for the batch operation for PM\textsubscript{10}.

For the furnace, it was shown earlier than 75% of PM emissions are PM\textsubscript{10}. Thus,

\[ \text{NEI}_{\text{furnacePM}} = \text{NEI}_{\text{furnacePM10}} \times 0.75 = 11,840 \text{ lb-PM10/year} \times 0.75 \]
\[ \text{NEI}_{\text{furnacePM}} = 15,787 \text{ lb-PM/year} \]

Since the batch operation is served by baghouses, all PM is expected to be PM\textsubscript{10}. Thus,

\[ \text{NEI}_{\text{batchPM}} = \text{NEI}_{\text{batchPM10}} = 4,238 \text{ lb-PM/year} \]
**Summary**

Therefore, the project will not trigger a PSD Major Modification.

**10. Quarterly Net Emissions Change (QNEC)**

The QNEC is calculated solely to establish emissions that are used to complete the District's PAS emissions profile screen. Detailed QNEC calculations are included in Appendix VII.

**VIII. Compliance**

**Rule 1080 Stack Monitoring**

This Rule grants the APCO the authority to request the installation and use of continuous emissions monitors (CEMs), and specifies performance standards for the equipment and administrative requirements for recordkeeping, reporting, and notification.

The furnace is equipped with operational CEMs for NOx and SOx from the shared stack. Compliance with the requirements of this Rule is anticipated.

The following conditions will be included on the Authority to Construct permit:

- The furnace shall have continuous monitoring systems for NOx and SOx. The monitoring devices shall have continuous recording devices, and all records shall be kept on site. [District Rules 1080 and 4354, §5.9]

- One continuous emissions monitoring (CEM) system may be used for monitoring oxy-fuel fired furnaces #1, #2, #3, and #4 provided all of the exhaust gases of each of these furnaces are ducted to a common stack, and monitored down stream of the common stack. The CEMS shall comply with the requirements of 40 Code of Federal Regulations (CFR) Part 51, 40 CFR Parts 60.7 and 60.13, 40 CFR Part 60 Appendix B (Performance Specifications) and Appendix F (Quality Assurance Procedures) and the applicable sections of Rule 1080 (Stack Monitoring). [District Rule 4354, 5.9 and 6.6.1]

- The facility shall install and maintain equipment, facilities, and systems compatible with the District's CEM data polling software system and shall make CEM data available to the District's automated polling system on a daily basis. [District Rule 1080]
• An annual Relative Accuracy Test Audit (RATA) shall be performed on the continuous monitoring system as outlined in 40 CFR Part 60 Appendix B. [District Rule 1080]

• The owner/operator shall perform a relative accuracy test audit (RATA) as specified by 40 CFR Part 60, Appendix F (CGAs and RATAs) and if applicable 40 CFR Part 75, Appendix B (linearity and RATAs) at least once every four calendar quarters and annually within 30 days of the anniversary date of the initial test. The permittee shall comply with the applicable requirements for quality assurance testing and maintenance of the continuous emission monitor equipment in accordance with the procedures and guidance specified in 40 CFR Part 60, Appendix F. [District Rule 1080]

• An exceedance of a NOx or SOx emission limit as indicated by the CEMS shall be reported by the operator to the APCO within 24 hours. The notification shall include 1) name and location of the facility, 2) identification of furnace(s) causing the exceedances, 3) calculation of actual NOx, CO and VOC emissions, and 4) corrective actions and schedules to complete the work. [District Rule 1080 and Stanislaus County Rule 1080]

• The operator shall notify the APCO no later than one hour after the detection of a breakdown of the CEMS. The operator shall inform the APCO of the intent to shut down the CEMS at least 24 hours prior to the event. [District Rule 1100]

• The permittee shall submit a written report including copies of any Equipment Breakdown reports and/or pertinent variance decisions to the APCO for each calendar quarter, within 30 days of the end of the quarter, including: time intervals, data and magnitude of excess emissions, nature and cause of excess emissions (if known), corrective actions taken and preventive measures adopted; averaging period used for data reporting shall correspond to the averaging period for each respective emission standard; applicable time and date of each period during which the CEM was inoperative (except for zero and span checks) and the nature of system repairs and adjustments; and a negative declaration when no excess emissions occurred. [District Rule 1080]

• Upon notice by the District that the facility's CEM system is not providing polling data, the facility may continue to operate without providing automated data for a maximum of 30 days per calendar year provided the CEM data is sent to the District by a District-approved alternative method. [District Rule 1080]

• Results of continuous emissions monitoring shall be reduced according to the procedure established in 40 CFR, Part 51, Appendix P, paragraphs 5.0 through 5.3.3, or by other methods deemed equivalent by mutual agreement with the District, the ARB, and the EPA. [District Rule 1080]

• Cylinder gas audits (GGAs) of continuous emission monitors shall be conducted quarterly, except during quarters in which relative accuracy and total accuracy testing is performed, in accordance with EPA guidelines. The District shall be notified prior to completion of the audits. Audit reports shall be submitted along with quarterly compliance reports to the District. [District Rule 1080]
• {2251} The owner or operator shall, upon written notice from the APCO, provide a summary of the data obtained from the CEM systems. This summary of data shall be in the form and the manner prescribed by the APCO. [District Rule 1080]

• Records shall be maintained and shall include: the occurrence and duration of any start-up, shutdown or malfunction, performance testing, evaluations, calibrations, checks, adjustments, any periods during which a continuous monitoring system or monitoring device is inoperative, maintenance of any CEMS that have been installed pursuant to District Rule 1080, and emission measurements. [District Rule 1080]

Rule 1081 Source Sampling

This rule requires adequate and safe facilities for use in sampling to determine compliance with emission limits, and specifies methods and procedures for source testing and sample collection. Compliance with this Rule is expected.

The following conditions will be included on the Authority to Construct permit:

• The exhaust stack shall be equipped with permanent provisions to allow collection of stack gas samples consistent with EPA test methods and shall be equipped with safe permanent provisions to sample stack gases with a portable NOx, CO, and O2 analyzer during District inspections. The sampling ports shall be located in accordance with the CARB regulation titled California Air Resources Board Air Monitoring Quality Assurance Volume VI, Standard Operating Procedures for Stationary Source Emission Monitoring and Testing. [District Rule 1081]

• Source testing to demonstrate compliance with permit conditions and all rules and regulations for both natural gas and LPG shall be conducted within 60 days after the end of the start-up exemption, and at least once every calendar year thereafter. NOx and CO testing shall be performed using CARB Method 100. VOC testing shall be performed using EPA method 25A. PM10 testing shall be performed using EPA methods 201 and 202, EPA methods 201a and 202, or CARB methods 501 and 5. SOx testing shall be performed using EPA Method 8 and CARB Method 1-100. [District Rules 1081, 2201, 2520, §9.3.2; and 4354, 6.4 and 6.5]

• Source testing when firing on LPG fuel need not be performed if the LPG fuel usage for this furnace does not exceed 100 hours during any one calendar year. A source test shall be performed within 90 days after this furnace exceeds 100 hours of operation, on LPG, on an annual basis. [District Rule 1081]

• Source testing shall be conducted by a CARB-certified source testing contractor. Source testing shall be conducted using the methods and procedures approved by the District. The District must be notified 30 days prior to any compliance source test, and a source test plan must be submitted for approval at least 15 days prior to source testing. The results of each source test shall be submitted to the District within 60 days after the source test date. [District Rule 1081]
• PM and PM10 source testing shall be conducted downstream of the electrostatic precipitator and the ceramic filter dust collector in the common stack. Furnaces #1, #2, #3, and #4 must operate simultaneously during source testing unless prior approval is obtained from the District. [District Rule 1081]

Rule 2201 New and Modified Stationary Source Review Rule

A. Best Available Control Technology (BACT)

1. BACT Applicability

BACT requirements are triggered on a pollutant-by-pollutant basis and on an emissions unit-by-emissions unit basis for the following*:

a. Any new emissions unit with a potential to emit exceeding two pounds per day,
b. The relocation from one Stationary Source to another of an existing emissions unit with a potential to emit exceeding two pounds per day,
c. Modifications to an existing emissions unit with a valid Permit to Operate resulting in an AIPE exceeding two pounds per day, and/or
d. Any new or modified emissions unit, in a stationary source project, which results in a Major Modification.

*Except for CO emissions from a new or modified emissions unit at a Stationary Source with an SSPE2 of less than 200,000 pounds per year of CO.

a. New emissions units with PE exceeding 2.0 lb/day

There are no new emission units.

b. The relocation of a unit from one stationary to another stationary source.

The applicant is not proposing to relocate any emissions units to another stationary source.

c. Modifications to an existing emissions unit with an Adjusted Increase in Potential to Emit (AIPE) exceeding 2.0 pounds per day.

The Adjusted Increase in Potential to Emit (AIPE) is determined as follows:

\[
AIPE = PE2 - HAPE \\
HAPE = PE1 \times (EF2 / EF1), \text{ For } EF2 > EF1, \ EF2 / EF1 = 1
\]

\[
HAPE = \text{Historically Adjusted Potential to Emit (lb/day)} \\
PE2 = \text{Post-Project Potential to Emit} \\
PE1 = \text{Pre-Project Potential to Emit} \\
EF2 = \text{Post-Project Emissions Factor} \\
EF1 = \text{Pre-Project Emissions Factor}
\]
AIPE = PE2 - PE1 x (EF2 + EF1)

The post-project stationary source potential to emit (SSPE2) is less than 200,000 lb-CO/year. Therefore, BACT cannot be triggered for CO emissions.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>PE2 (lb/day)</th>
<th>PE1 (lb/day)</th>
<th>EF2 (lb/ton)</th>
<th>EF1 (lb/ton)</th>
<th>AIPE (lb/day)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td>559.0</td>
<td>492.9</td>
<td>1.3</td>
<td>1.4</td>
<td>101.3</td>
</tr>
<tr>
<td>SOx</td>
<td>425.7</td>
<td>348.6</td>
<td>0.99</td>
<td>0.99</td>
<td>77.1</td>
</tr>
<tr>
<td>PM10</td>
<td>305.3</td>
<td>250.0</td>
<td>0.71</td>
<td>0.71</td>
<td>55.3</td>
</tr>
<tr>
<td>VOC</td>
<td>4.3</td>
<td>81.0</td>
<td>0.01</td>
<td>0.23</td>
<td>0.8</td>
</tr>
</tbody>
</table>

As demonstrated above, AIPE is greater than 2.0 lb/day for NOx, SOx, and PM10; therefore, BACT is triggered for these pollutants.

d. Any new or modified emissions unit, in a stationary source project, which results in a major modification.

This project triggers an SB288 Modification for NOx and PM10 emissions and triggers a Federal Major Modification for NOx and VOC emissions. Therefore, BACT is triggered for NOx, PM10, and VOC emissions.

As shown above, BACT is triggered for NOx, SOx, PM10, and VOC emissions.

2. BACT Guideline

BACT Guideline 1.5.9, for container glass production, is applicable to the glass furnace in this project. For a copy of the BACT Guideline, see Appendix IV.

3. Top-Down BACT Analysis

Per the Top-Down BACT Analysis in Appendix IV, BACT is satisfied with the following:

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and NOx emissions of &lt; or = 1.3 lb/ton of glass pulled</td>
</tr>
<tr>
<td>SOx</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and SOx emissions of &lt; or = 0.8 lb/ton of glass pulled when total cullet is &lt; 25% mixed color cullet, and SOx emissions of &lt; or = 1.1 lb/ton of glass pulled when total cullet is &gt; or = 25% mixed color cullet</td>
</tr>
<tr>
<td>PM10</td>
<td>Natural gas-fired furnace oxy-fuel furnace with an electrostatic precipitator in series with a semi-dry scrubber, using LPG backup fuel and PM10 emissions of &lt; or = 0.45 lb/ton of glass pulled</td>
</tr>
<tr>
<td>VOC</td>
<td>Natural gas-fired oxy-fuel furnace with LPG backup fuel, and VOC emissions of &lt; or = 0.01 lb/ton of glass pulled (95% control efficiency)</td>
</tr>
</tbody>
</table>

As shown in the Top-Down BACT Analysis in Appendix IV, the facilities proposal meets the above requirements. Therefore, BACT requirements are satisfied by this proposal.
B. Offsets

1. Offset Applicability:

Pursuant to Section 4.5.3, offset requirements shall be triggered on a pollutant by pollutant basis and shall be required if the Post-project Stationary Source Potential to Emit (SSPE2) equals to or exceeds emissions of 20,000 lbs/year for NO\textsubscript{x} and VOC, 200,000 lbs/year for CO, 54,750 lbs/year for SO\textsubscript{x} and 29,200 lbs/year for PM\textsubscript{10}.

<table>
<thead>
<tr>
<th>Offset Determination</th>
<th>NO\textsubscript{x} (lb/year)</th>
<th>CO (lb/year)</th>
<th>VOC (lb/year)</th>
<th>PM\textsubscript{10} (lb/year)</th>
<th>SO\textsubscript{x} (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post-project SSPE2 (w/ERC's)</td>
<td>2,069,786</td>
<td>99,437</td>
<td>129,912</td>
<td>503,670</td>
<td>704,639</td>
</tr>
<tr>
<td>Offset Threshold</td>
<td>20,000</td>
<td>200,000</td>
<td>20,000</td>
<td>29,200</td>
<td>54,750</td>
</tr>
<tr>
<td>Offsets Triggered?</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Offsets for PM2.5 are not triggered, since this project is not a Federal Major Modification for PM2.5.

2. Quantity of Offsets Required:

Per Sections 4.7.2 and 4.7.3, the quantity of offsets, in pounds per year, is calculated as follows for sources with an SSPE1 greater than the offset threshold levels before implementing the project being evaluated.

Offsets Required (lb/year) = ([SSPE2 – BE] + ICCE) x DOR, for all new or modified emissions units in the project,

Where,

SSPE2 = Post Project Facility Potential to Emit, (lb/year)
BE = Baseline Emissions (lb/year)
ICCE = Increase in Cargo Carrier Emissions, (lb/year)
DOR = Distance Offset Ratio, determined pursuant to Section 4.8

As stated in the calculations section earlier, BE is equivalent to PE1 for NO\textsubscript{x}, SO\textsubscript{x}, PM\textsubscript{10}, and VOC emissions, since the glass furnace is a clean emission unit for those pollutants.

The quantity of offsets required for each pollutant is shown in the following table.

<table>
<thead>
<tr>
<th>Offset Quantity Determination (N-4597-2-17)</th>
<th>NO\textsubscript{x} (lb/year)</th>
<th>SO\textsubscript{x} (lb/year)</th>
<th>PM\textsubscript{10} (lb/year)</th>
<th>VOC (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PE2</td>
<td>204,035</td>
<td>155,381</td>
<td>71,298</td>
<td>1,570</td>
</tr>
<tr>
<td>PE1</td>
<td>179,923</td>
<td>127,231</td>
<td>58,382</td>
<td>29,559</td>
</tr>
<tr>
<td>Difference</td>
<td>24,112</td>
<td>28,150</td>
<td>12,916</td>
<td>-27,989</td>
</tr>
</tbody>
</table>
**NOx**

The following table shows the quantity of offsets required by quarter for NOx, which have been calculated using the ratio of the number of days per quarter to the number of days/year. Since this is a Federal Major Modification for NOx, the distance ratio is 1.5 per Section 4.8.1 of District Rule 2201. The facility has proposed to use ERC Certificate N-768-2 to offset the NOx emissions from this project.

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Days</td>
<td>90</td>
<td>91</td>
<td>92</td>
<td>92</td>
</tr>
<tr>
<td>Quantity of NOx Offsets Required (lb) without the distance ratio</td>
<td>5,945</td>
<td>6,011</td>
<td>6,078</td>
<td>6,078</td>
</tr>
<tr>
<td>Distance Ratio</td>
<td>1.5</td>
<td>1.5</td>
<td>1.5</td>
<td>1.5</td>
</tr>
<tr>
<td>Quantity of NOx Offsets Required (lb) with the distance ratio</td>
<td>8,918</td>
<td>9,017</td>
<td>9,117</td>
<td>9,117</td>
</tr>
<tr>
<td>Quantity of ERC's Reserved from N-768-2</td>
<td>8,918</td>
<td>9,017</td>
<td>9,242</td>
<td>8,992</td>
</tr>
</tbody>
</table>

Pursuant to District Rule 2201, actual NOx emission reductions from April through November may be used to offset emissions during anytime of the year. For this project, 125 lb-NOx from quarter 3 of ERC certificate N-768-2 will be used to satisfy the quarter 4 offset requirements. The quantity of NOx credits available from ERC Credit N-768-2 is sufficient to offset emissions from the project.

**SOx**

The following table shows the quantity of offsets required by quarter for SOx, which have been calculated using the ratio of the number of days per quarter to the number of days/year. The facility has proposed to use ERC Certificates S-4214-5, S-4215-5, C-1280-5, and C-1281-5 to offset the SOx emissions from this project. The sources of all the proposed ERC credits are more than 15 miles from the glass plant; therefore, an offset distance ratio of 1.5 is applicable per District Rule 2201 4.8.4.

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>

<td>2,265</td>
<td>2,380</td>
<td>2,495</td>
<td>2,496</td>
</tr>
<tr>
<td>Total Quantity of ERC's Reserved</td>
<td>10,412</td>
<td>10,527</td>
<td>10,643</td>
<td>10,644</td>
</tr>
</tbody>
</table>

The quantity of SOx credits available from the proposed emission reduction certificates is sufficient to offset emissions from the project.
PM10

The following table shows the quantity of offsets required by quarter for PM10, which have been calculated using the ratio of the number of days per quarter to the number of days/year. The facility has proposed to use ERC Certificate N-161-4 to offset the PM10 emissions from this project. Since the reductions that generated the credits for N-161-4 were from the same stationary source, the offset distance ratio is 1.0.

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Q1</th>

<tr>
<td>Quantity of ERC's Reserved from N-161-4</td>
<td>3,185</td>
<td>3,220</td>
<td>3,255</td>
<td>3,256</td>
</tr>
</tbody>
</table>

The quantity of PM10 credits available from ERC Credit N-161-4 is sufficient to offset emissions from the project.

C. Public Notification

1. Applicability

Public noticing is required for:
   a. Any new Major Source, which is a new facility that is also a Major Source,
   b. Major Modifications,
   c. Any new emissions unit with a Potential to Emit greater than 100 pounds during any one day for any one pollutant,
   d. Any project which results in the offset thresholds being surpassed, and/or
   e. Any project with an SSIPE of greater than 20,000 lb/year for any pollutant.

   a. New Major Source

New Major Sources are new facilities, which are also Major Sources. Since this is not a new facility, public noticing is not required for this project for New Major Source purposes.

   b. Major Modification

As demonstrated in VII.C.7, this project triggers both an SB288 modification and a Federal Major Modification. Therefore, a public notice is required for Major Modification purposes.
c. PE > 100 lb/day

Applications which include a new emissions unit with a PE greater than 100 pounds during any one day for any pollutant will trigger public noticing requirements. There are no new emissions units proposed in this project. Therefore, public noticing is not required for this purpose.

d. Offset Threshold

The following table compares the SSPE1 with the SSPE2 in order to determine if any offset thresholds have been surpassed with this project.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>SSPE1 w/ERC (lb/year)</th>
<th>SSPE2 w/ERC (lb/year)</th>
<th>Offset Threshold</th>
<th>Offset Threshold Surpassed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td>2,045,674</td>
<td>2,069,786</td>
<td>20,000 lb/year</td>
<td>No</td>
</tr>
<tr>
<td>SOx</td>
<td>676,489</td>
<td>704,639</td>
<td>54,750 lb/year</td>
<td>No</td>
</tr>
<tr>
<td>PM10</td>
<td>490,754</td>
<td>503,670</td>
<td>29,200 lb/year</td>
<td>No</td>
</tr>
<tr>
<td>CO</td>
<td>183,712</td>
<td>99,437</td>
<td>200,000 lb/year</td>
<td>No</td>
</tr>
<tr>
<td>VOC</td>
<td>157,901</td>
<td>129,912</td>
<td>20,000 lb/year</td>
<td>No</td>
</tr>
</tbody>
</table>

The offset thresholds for NOx, SOx, PM10, and VOC have already been surpassed. Therefore, public notice is not required for this purpose.

e. SSIPE > 20,000 lb/year

Public notification is required for any permitting action that results in a Stationary Source Increase in Permitted Emissions (SSIPE) of more than 20,000 lb/year of any affected pollutant. According to District policy, the SSIPE is calculated as the Post Project Stationary Source Potential to Emit (SSPE2) minus the Pre-Project Stationary Source Potential to Emit (SSPE1), i.e. SSIPE = SSPE2 - SSPE1. The values for SSPE2 and SSPE1 are calculated according to Rule 2201, Sections 4.9 and 4.10, respectively. The SSIPE is compared to the SSIPE Public Notice thresholds in the following table:

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>SSPE2 w/ERC (lb/year)</th>
<th>SSPE1 w/ERC (lb/year)</th>
<th>SSIPE (lb/year)</th>
<th>SSIPE Public Notice Threshold</th>
<th>Public Notice Required?</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td>2,069,786</td>
<td>2,045,674</td>
<td>24,112</td>
<td>20,000 lb/year</td>
<td>Yes</td>

</table>

As demonstrated in the table above, a public notice is required for SSIPE greater than 20,000 lb/year.
2. Public Notice Action

As discussed above, public noticing is required for this project since the project triggers a Major Modification and since the SSIPE is greater than 20,000 lb/year for NOx and SOx. Therefore, public notice documents will be submitted to the California Air Resources Board (CARB) and US EPA, and a public notice will be published in a local newspaper of general circulation prior to the issuance of the ATC for this equipment.

D. Daily Emission Limits (DELs)

Daily Emissions Limitations (DELs) and other enforceable conditions are required by Section 3.16 to restrict a unit's maximum daily emissions, to a level at or below the emissions associated with the maximum design capacity. Per Sections 3.16.1 and 3.16.2, the DEL must be contained in the latest ATC and contained in or enforced by the latest PTO and enforceable, in a practicable manner, on a daily basis. DELs are also required to enforce the applicability of BACT.

The following conditions will be included on the Authority to Construct permit for this furnace.

- The quantity of glass produced shall not exceed 430 tons during any one day. [District Rules 2201 and 4354]
- NOx emissions shall not exceed 1.3 pounds per ton of glass produced (over a rolling 30-day average). This performance based limit is to enforce the NOx emission reductions granted by certificate number N-54-2. [District NSR Rule]
- CO emissions shall not exceed 0.2 pounds per ton of glass produced. [District NSR Rule]
- The VOC emissions shall not exceed 0.01 pounds per ton of glass produced. [District Rule 2201]
- The combined SOx emissions from permit units N-1662-1, N-1662-2, N-1662-3 and N-1662-4, while producing glass with equal to or greater than 25% by weight mixed color cullet, shall not exceed 0.99 lb/ton of glass produced (over a rolling 30 day average). [District Rules 2201 and 4354]
- The combined SOx emissions from permit units N-1662-1, N-1662-2, N-1662-3 and N-1662-4, while producing glass with less than 25% by weight mixed color cullet, shall not exceed 0.81 lb/ton of glass produced (over a rolling 30 day average). [District Rules 2201 and 4354]
- The PM10 emissions, except during full or partial emission control system bypass episodes, shall not exceed 0.45 lb/ton of glass produced. [District NSR Rules 2201 and 4354]
- The PM10 emissions, during full or partial emission control system bypass episodes, shall not exceed 0.71 lb/ton of glass produced. [District Rule 2201]
• The amount of time that the furnace exhaust is not fully treated by a control device shall not exceed 144 hours per calendar year. [District Rules 2201 and 4354]

• The PM10 emissions shall not exceed 18,712 pounds during the first calendar quarter, 18,919 pounds during the second calendar quarter, 19,127 pounds during the third calendar quarter and 19,128 pounds during the fourth calendar quarter. These limits are to enforce the PM10 emission reductions granted by certificate number N-161-4. [District NSR Rule]

E. Compliance Assurance

1. Source Testing

Initial and annual source testing will be required for NOx, SOx, CO, PM10, and VOC emissions for the glass furnace. The following conditions will be included on the Authority to Construct permit:

• Source testing to demonstrate compliance with permit conditions and all rules and regulations for both natural gas and LPG shall be conducted within 60 days after the end of the start-up exemption, and at least once every calendar year thereafter. NOx and CO testing shall be performed using CARB Method 100. VOC testing shall be performed using EPA method 25A. PM10 testing shall be performed using EPA methods 201 and 202, EPA methods 201a and 202, or CARB methods 501 and 5. SOx testing shall be performed using EPA Method 8 and CARB Method 1-100. [District Rules 1081, 2201, 2520, §9.3.2; and 4354, 6.4 and 6.5]

2. Monitoring

This glass furnace shares a stack with three other glass furnaces. The shared stack is equipped with a CEMS for NOx and SOx. Further information on the requirements for the CEMS is included in the District Rule 1080 and District Rule 4354 section of this document.

Additionally, District Rule 4354 requires monitoring of PM10, CO, and VOC emissions. The applicant has chosen to monitor these pollutants using parametric monitoring systems. The parametric monitoring system requirements are discussed further in the Rule 4354 section of this document.

Current PTO N-1662-2-16 includes a condition that requires PM10 emissions not to exceed 15,527 lb-PM10 in the 1st quarter, 15,699 lb-PM10 in the 2nd quarter, 15,672 lb-PM10 in the 3rd quarter, and 15,827 lb-PM10 in the 4th quarter, to enforce ERC certificate N-161-4. In this project, the facility will be offsetting 3,185 lb-PM10 in the 1st quarter, 3,220 lb-PM10 in the 2nd quarter, 3,255 lb-PM10 in the 3rd quarter, and 3,256 lb-PM10 in the 4th quarter. These quantities have been added to determine the final quarterly emission limit for PM10, to ensure the PM10 emission reductions for ERC N-161-4 continue to be enforced.
3. Recordkeeping

In addition to the recordkeeping requirements that are included in the District Rule 4354 section of this document, the following recordkeeping requirements will be included on the Authority to Construct permit:

- Permittee shall keep a record of the daily hours of operation, the amount of glass pulled from the furnace (in tons), the NOx emissions (in lb/ton of glass pulled), the SOx emissions (in lb/ton of glass pulled), the weight of mixed color mix cullet used, the total amount of cullet used (by weight) and the ratio of the mixed color cullet weight to the total cullet weight (in percent). [District Rules 2201 and 4354]

- A record of the PM10 emissions from this unit, in pounds per calendar quarter, shall be kept. [District Rule 2201]

- A record of the cumulative annual number of hours that the emission control system is either fully or partially bypassed shall be kept. The record shall be updated at least weekly. [District Rules 2201 and 4354]

- The operator shall monitor and record the pressure differential gauge reading of the ceramic filter dust collector at least once during each day that the unit operates. [District Rules 2201 and 4354 and 40 CFR Part 64]

- Records of dust collector maintenance, inspections and repairs shall be maintained. The records shall include, date of inspection, change outs of filter media, corrective action taken, and identification of the individual performing the inspection. [District Rules 2201 and 2520, 9.4.2]

- The permittee shall keep a record of the cumulative annual hours of operation of the glass furnace on LPG fuel. [District Rule 2201]

4. Reporting

Reporting is not required for District Rule 2201 for this operation.

F. Ambient Air Quality Analysis (AAQA)

An AAQA shall be conducted for the purpose of determining whether a new or modified Stationary Source will cause or make worse a violation of an air quality standard. The District’s Technical Services Division conducted the required analysis. Refer to Appendix V of this document for the AAQA summary sheet.

The proposed location is in an attainment area for NOX, CO, and SOX. As shown by the AAQA summary sheet the proposed equipment will not cause a violation of an air quality standard for NOX, CO, or SOX.

The proposed location is in a non-attainment area for the state’s PM10 as well as federal and state PM2.5 thresholds. As shown by the AAQA summary sheet the proposed equipment will not cause a violation of an air quality standard for PM10 and PM2.5.
G. Compliance Certification

Section 4.15.2 of this Rule requires the owner of a new Major Source or a source undergoing a Title I Modification to demonstrate to the satisfaction of the District that all other Major Sources owned by such person and operating in California are in compliance or are on a schedule for compliance with all applicable emission limitations and standards. As discussed in Section VIII above, this facility triggers a Federal Major Modification, therefore this requirement is applicable. Gallo also owns:

1. A Modesto Winery
2. A Livingston Winery; and
3. A Fresno Winery.

The application submitted by Gallo Glass Company states that all these sources currently comply with the applicable emission limitations and standards. Therefore, this requirement is satisfied.

H. Alternate Siting Analysis

The current project occurs at an existing facility. The applicant is proposing to rebuild and expand an existing glass furnace.

Use of the existing site will result in the least possible impact from the project. Alternative sites would involve the relocation and/or construction of various support structures on a much greater scale, and would therefore result in a much greater impact.

Rule 2410 Prevention of Significant Deterioration

As demonstrated earlier in this project, District Rule 2410 requirements are not applicable to this project.

Rule 2520 Federally Mandated Operating Permits

This facility is subject to this Rule, and has received their Title V Operating Permit. A significant permit modification is defined as a "permit amendment that does not qualify as a minor permit modification or administrative amendment, since the project is a Major Modification. Therefore, a public notice must be performed prior to issuance of the Authority to Construct permit.

As discussed above, the facility has applied for a Certificate of Conformity (COC). Therefore, the facility must apply to modify their Title V permit with an administrative amendment, prior to operating with the proposed modifications. Continued compliance with this rule is expected. The facility may construct/operate under the ATC upon submittal of the Title V administrative amendment application.
Rule 4001  New Source Performance Standards (NSPS)

40 CFR Part 60 Subpart CC, "Standards of Performance for Glass Manufacturing Plants" applies to each glass furnace that commences construction or modification after June 15, 1979.

This project will be a modification to the glass furnace. Therefore, Subpart CC requirements are applicable to the furnace. The furnace uses a modified process (oxy-fuel firing); therefore, the requirements of 60.292 do not apply.

Section 60.293(b)(2) states that glass furnaces using a modified process and manufacturing pressed and blown glass with a borosilicate recipe must meet a rate of 1.0 g-PM/KG of glass produced. Using conversion factors of 453.6 g/lb and 907.18 kg/ton, this emission rate is equal to 2.0 lb-PM/ton of glass produced.

The unit is limited to 0.45 lb-PM10/ton. Per AP-42 table 11.15.3, approximately 75% of PM is PM10 for a controlled furnace. Using this ratio and the proposed 0.45 lb-PM10/ton of glass produced limit, the expected PM rate from the furnace is:

\[ \text{PM EF} = 0.45 \text{ lb-PM10/ton of glass} \times 1 \text{ lb-PM/0.75 lb-PM10} = 0.6 \text{ lb-PM/ton} \]

Therefore, compliance with the 1.0 g-PM/KG of glass produced limit is expected. The following condition will be placed on the permit:

- PM emissions from the glass furnace shall not exceed 1 gram of particulate matter per kilogram of glass produced. [40 CFR 60.293(b)(2)]

Section 60.293(c) requires the facility to install a continuous opacity monitoring system; however, Section 60.293(d) allows the facility to request that an alternate continuous monitoring system for the measurement of one or more process or operating parameters that is or are demonstrated to enable accurate and representative monitoring of an emission limit be used in lieu of a continuous opacity monitor. Gallo Glass Company currently employs a continuous monitoring system that monitors the primary and secondary voltage and current of the electrostatic precipitator, and such monitoring has previously been determined to be adequate to show compliance with the PM10 emission limit for District Rule 4354 and Compliance Assurance Monitoring purposes. Therefore, the use of a continuous monitoring system to measure primary and secondary voltage and current of the electrostatic precipitator system is an accurate and representative continuous alternate monitoring scheme, and will be used in lieu of installing a continuous opacity monitoring system. The following conditions will be included on the Authority to Construct permit:

- Devices to measure the primary and secondary voltage and current of the electrostatic precipitator shall be maintained in accordance with the manufacturer's specifications. [District Rule 4354, 40 CFR 60.293(d), and 40 CFR Part 64]

- The specific power of the electrostatic precipitator shall be at least 70 milliwatts/acfpm except during the bypass episodes allowed by this permit. [District Rule 2520, §9.3.2, 40 CFR 60.293(d), and 40 CFR Part 64]
• The specific power of the electrostatic precipitator shall be continuously monitored and recorded. [District Rules 2201 and 4354, 40 CFR 60.293(d), and 40 CFR Part 64]

• The permittee shall maintain daily records of the specific power of the electrostatic precipitator (in milliwatts/acfm). [District Rules 2201, 4354, 40 CFR 60.293(d) and 40 CFR Part 64]

Rule 4002 National Emission Standards for Hazardous Air Pollutants

This subpart is applicable to glass melting furnaces that use commercial arsenic as a raw material. This furnace is currently prohibited from using arsenic as a raw material by a permit condition and this permit condition will remain on the glass furnace permit; therefore, Subpart N requirements are not applicable to this glass furnace.

40 CFR Part 63 Subpart SSSSSS, National Emission Standards for Hazardous Air Pollutants for Glass Manufacturing Area Sources

Subpart SSSSSS is applicable to glass manufacturing furnaces that meet all of the following criteria:

1. The source is a glass manufacturing facility is a plant site that manufactures flat glass, glass containers, or pressed and blown glass by melting a mixture of raw materials to produce molten glass and form the molten glass into sheets, containers, or other shapes;
2. The source is an area source of HAP emissions; and
3. The glass manufacturing facility uses one or more continuous furnaces to produce glass that contains compounds of one or more glass manufacturing metal HAP as raw materials in a glass manufacturing batch formulation.

This facility is subject to Subpart SSSSSS requirements and compliance was determined in a previous permitting evaluation (see District Project N-1103820). This furnace rebuild is not expected to alter the metal HAP emission rate, in lb/ton, for the furnace. Therefore, continued compliance is expected. The following condition will be included on the Authority to Construct permit:

• Any glass melting furnace located at an Area Source of hazardous air pollutants shall comply with 40 CFR Part 63 Subpart SSSSSS (National Emission Standards for Hazardous Air Pollutants for Glass Manufacturing Area Sources). [40 CFR Part 63 Subpart SSSSSS]
Rule 4101 Visible Emissions

District Rule 4101, Section 5.0, indicates that no air contaminant shall be discharged into the atmosphere for a period or periods aggregating more than three minutes in any one hour, which is dark or darker than Ringelmann 1 or equivalent to 20% opacity. The following condition will be listed on the Authority to Construct permit:

- {4383} No air contaminants shall be discharged into the atmosphere for a period or periods aggregating more than 3 minutes in any one hour which is as dark or darker than Ringelmann #1 or equivalent to 20% opacity and greater, unless specifically exempted by District Rule 4101 (02/17/05). If the equipment or operation is subject to a more stringent visible emission standard as prescribed in a permit condition, the more stringent visible emission limit shall supersede this condition. [District Rule 4101, and County Rules 401 (in all eight counties in the San Joaquin Valley)]

Rule 4102 Nuisance

Section 4.0 prohibits discharge of air contaminants, which could cause injury, detriment, nuisance or annoyance to the public. Public nuisance conditions are not expected as a result of these operations provided the equipment is well maintained. Therefore, compliance with this rule is expected.

The following condition will be included on the Authority to Construct permit:

- No air contaminant shall be released into the atmosphere, which causes a public nuisance. [District Rule 4102]

California Health & Safety Code 41700 (Health Risk Assessment)

District Policy APR 1905 — Risk Management Policy for Permitting New and Modified Sources specifies that for an increase in emissions associated with a proposed new source or modification, the District perform an analysis to determine the possible impact to the nearest resident or worksite.

A risk management review (RMR) was conducted. The following table summarizes the results of the RMR. For the complete summary, please see Appendix V.

T-BACT

T-BACT is triggered for PM10 from the glass furnace. T-BACT is satisfied with BACT for PM10. The BACT requirement for PM10 is use of an electrostatic precipitator and a PM10 emission rate equal to or less than 0.45 lb-PM10/ton. The applicant is proposing to meet this level of control. Therefore, the furnace satisfies the T-BACT emission requirements.

Rule 4201 Particulate Matter Concentration

Section 3.1 prohibits discharge of dust, fumes, or total particulate matter into the atmosphere from any single source operation in excess of 0.1 grain per dry standard cubic foot. As shown in the calculations below, compliance is expected for the glass furnace.

Source testing was conducted in 1994 to determine the particulate matter concentration from this furnace, when bypassing the electrostatic precipitator. The highest concentration recorded was 0.063 gr-PM/dscf. This project will result in a 22% increase in PM emissions (based on the daily PM10 emission rates). Thus, the grain loading is expected to also increase by 22%, for an expected grain loading of:

Expected Grain Loading = 0.063 gr-PM/dscf x 1.22 = 0.077 gr-PM/dscf

Rule 4202 Particulate Matter Emission Rate

Per Section 4.1, particulate matter emissions from any source operation shall not exceed the allowable hourly emission rate (E) as calculated using the following formulas:

\[ E \ (\text{lb/hr}) = 3.59 \ P^{0.62} \quad \text{for process rates} \leq 30 \ \text{tons/hr}, \text{and} \]
\[ E \ (\text{lb/hr}) = 17.31 \ P^{0.16} \quad \text{for process rates} > 30 \ \text{tons/hr} \]

Where,

\[ P = \text{process weight in tons/hr} \]

Daily Throughput: 430 tons/day
Hourly Throughput = 430 tons/day ÷ 24 hr/day = 17.92 tons/hr

\[ E \ (\text{lb/hr}) = 3.59 \times (17.92 \ \text{tons/hr})^{0.62} \]
\[ E \ (\text{lb/hr}) = 21.49 \ \text{lb-PM/hr} \]

The worst-case PM10 emission rate is 305.3 lb-PM10/day, while bypassing the electrostatic precipitator. Per AP-42 Table 11.15-3, 95% of the PM is expected to be PM10 when the furnace is uncontrolled. Thus,

Actual PM Rate = 305.3 lb-PM10/day x 1 lb-PM/0.95 lb-PM10 ÷ 24 hr/day
Actual PM Rate = 13.39 lb-PM/hr

Since the actual hourly PM emission rate of 13.39 lb-PM/hr is less than the allowable PM emission rate of 21.49 lb-PM/hr, compliance with District Rule 4202 is expected.
Rule 4301 Fuel Burning Equipment

This rule applies to fuel burning equipment, which is defined as any furnace, boiler, apparatus, stack, and all appurtenances thereto, used in the process of burning fuel for the primary purpose of producing heat or power by indirect heat transfer. The glass melting furnace is a direct-fired unit and does not produce heat or power by indirect heat transfer. Therefore, the requirements of District Rule 4301 are not applicable to the glass melting furnace.

District Rule 4354 Glass Melting Furnaces

This rule is applicable to any glass melting furnace. The glass melting furnace in this project is subject to District Rule 4354 requirements.

Section 5.1: NOx Emission Limits

Section 5.1.1 Table 1 lists a NOx requirement of 1.5 lb/ton (on a rolling 30-day average) for container glass furnaces. Since compliance is demonstrated for all four furnaces as a furnace battery, a 10% air quality benefit applies, and the limit with the 10% benefit would be 1.4 lb/ton. The facility has proposed a NOx limit of 1.3 lb/ton (on a rolling 30-day average). Therefore, compliance is expected.

Section 5.2: CO and VOC Emission Limits

Section 5.2.1 Table 2 lists a CO requirement of 1.0 lb/ton of glass produced, and a VOC requirement of 0.25 lb/ton of glass produced. Since compliance is demonstrated for all four furnaces as a furnace battery, a 10% air quality benefit applies, and the limits with the 10% benefit would be 0.9 lb-CO/ton and 0.23 lb-VOC/ton. The facility has proposed a CO limit of 0.2 lb/ton of glass produced and a VOC limit of 0.01 lb/ton of glass produced. Therefore, compliance is expected.

Section 5.3: SOx Emission Limits

Section 5.3.2 Table 3 of this rule lists a SOx requirement of 1.1 lb/ton of glass produced (when the total cullet used is more than 25.0% mixed color cullet) and 0.9 lb/ton otherwise, both based on a 30-day rolling average. Since compliance is demonstrated for all four furnaces as a furnace battery, a 10% air quality benefit applies, and the limits with the 10% benefit would be 0.99 lb-SOx/ton (>25% mixed color cullet) and 0.81 lb-SOx/ton (otherwise). The facility has proposed these emission limits; therefore, compliance is expected.

Section 5.4: PM10 emission limits

Section 5.4 Table 4 lists a PM10 requirement of 0.5 lb/ton for container glass furnaces. Since compliance is demonstrated for all four furnaces as a furnace battery, a 10% air quality benefit applies, and the limit with the 10% benefit would be 0.45 lb/ton. The facility has proposed this limit; therefore compliance is expected.
Section 5.5: Start-up Requirements

Sections 5.5.1 through 5.5.7 list furnace start-up requirements for start-ups associated with a furnace rebuild.

Section 5.5.1 states that the operator must submit a request for start-up exemption to the APCO, ARB, and EPA in conjunction with or in advance of an application for an Authority to Construct associated with a furnace rebuild. Gallo Glass has submitted a formal request for the start-up exemption with their Authority to Construct application (see appendix VI). Therefore, this requirement is satisfied.

Section 5.5.2 states that the operator must submit to the APCO, ARB, and EPA any information necessary to determine the appropriate length of start-up exemption. This information was included with the request for the startup exemption; therefore, this requirement has been satisfied.

Section 5.5.3 states that the start-up exemption shall begin upon activation of the primary combustion system. Compliance with this requirement is expected. The following condition will be included on the Authority to Construct permit:

- Startup exemption time period shall not exceed 18 days, beginning from the time of primary combustion system activation. [District Rule 4354]

Section 5.5.4 states that the approved length of start-up exemption shall be determined by the APCO, ARB, and EPA at the time of ATC issuance, but in any case shall not exceed 104 days if using a typical NOx control system, or 208 days if using an innovate NOx control system that meets the requirements of Section 5.5.4.2. The facility has requested an 18-day startup exemption period which satisfies the requirements of Section 5.5.4. The following condition will be included on the Authority to Construct permit:

- The startup exemption time period shall not exceed 18 days, beginning from the time of primary combustion system activation. [District Rule 4354]

Section 5.5.5 states that, during the startup period, the stoichiometric ratio of the primary furnace combustion system must not exceed 5% excess oxygen, except during the time when the oxidant stream for an oxy-fuel fired furnace contains at least 50% oxygen. The following condition will be included on the Authority to Construct permit:

- During start-up period, the stoichiometric ratio of the primary furnace combustion system shall not exceed 5% excess oxygen, as calculated from the actual fuel and oxidant flow measurements for combustion in the furnace, except during the time when the oxidant stream for an oxy-fuel fired furnace contains at least 50% oxygen. [District Rule 4354]

Section 5.5.6 states that the emission control system must be in operation as soon as technologically feasible during start-up to minimize emissions. The following condition will be included on the Authority to Construct permit:
• The emission control systems shall be in operation whenever conditions are consistent with manufacturer's specifications during startup, idling and shutdown periods. [District Rule 4354]

Section 5.5.7 states that notifications must be performed and records kept in accordance with Section 6.7. Compliance with this requirement is expected.

Section 5.6: Shutdown

Section 5.6 lists the following shutdown requirements for glass furnaces:

1. The duration of shutdown, as measured from the time the furnace operations drop below the idle threshold to when all emissions from the furnace cease, must not exceed 20 days;
2. The emission control system must be in operation whenever technologically feasible during shutdown to minimize emissions; and
3. Notifications must be performed and records kept in accordance with Section 6.7.

The following conditions will be included on the Authority to Construct permit:

• The duration of a furnace shutdown shall not exceed 20 days, measured from the time furnace operations drop below the idle threshold specified in Section 3.17 of District Rule 4354 to when all emissions from the furnace cease. [District Rule 4354]

• The emission control systems shall be in operation whenever conditions are consistent with manufacturer's specifications during startup, idling and shutdown periods. [District Rule 4354]

Section 5.7: Idling Requirements

Section 5.7.1 states that the emission control system shall be in operation whenever technologically feasible during idling to minimize emissions. The following condition will be included on the Authority to Construct permit:

• The emission control systems shall be in operation whenever conditions are consistent with manufacturer's specifications during startup, idling and shutdown periods. [District Rule 4354]

Section 5.7.2 states that the emissions of NOx, CO, VOC, SOx, and PM10 during idling shall not exceed the amount as calculated using the following equation:

\[ E_{i,\text{max}} = E_{i} \times \text{Capacity} \]

Where,

\[ E_{i,\text{max}} = \text{maximum daily emissions of pollutant i during idling, in lb per day.} \]
\[ E_{i} = \text{Applicable emission limit for pollutant i, in lb per ton.} \]
\[ \text{Capacity} = \text{Furnace's permitted glass production capacity in tons glass produced per day.} \]
The following condition will be included on the Authority to Construct permit:

- NOx, CO, VOC, SOx, and PM10 emissions during idling shall not exceed the amount as calculated using the following equation: NOx, CO, VOC, SOx, or PM10 (lb/day) = Applicable emission limit (lb/ton) x Furnace permitted production capacity (tons/day). [District Rule 4354]

Section 5.7.3 states that notifications must be performed and records kept in accordance with Section 6.7. Compliance is expected with this requirement.

Section 5.8 Compliance Determination

This section states that any source test result, CEMS, or alternate emission monitoring method averaged value exceeding the applicable emission limits in Section 5.1, Section 5.2, Section 5.3, or Section 5.4 will constitute a violation of the rule. Compliance is expected with this requirement. A condition will be included on the Authority to Construct permit.

Section 5.9: Monitoring Requirements

Section 5.9.1 lists NOx emission monitoring requirements. The operator of any glass melting furnace must implement a NOx CEMS that meets the requirements of Section 6.6. The applicant is proposing the use of a NOx CEMS on this furnace and compliance with this requirement is expected. Permit conditions outlining the CEMS requirements were included earlier in this evaluation.

Section 5.9.2.1 requires each furnace subject to Table 2 CO limits to implement the use of a CO CEMS that meets the requirements of Section 6.6.1. Section 5.9.2.3 states that in lieu of installing and operating a CEMS for CO, an operator may propose an alternate monitoring scheme for CO. Gallo Glass Company previously received approval of an alternate monitoring scheme for CO from the District. The following conditions will be included on the Authority to Construct permit:

- The oxygen to fuel ratio shall be continuously monitored and recorded. [District Rule 4354]
- The permittee shall maintain the burner oxygen to fuel ratio records required by this permit. [District Rules 2201 and 4354]

Section 5.9.2.2 requires each furnace subject to Table 2 VOC limits to implement the use of a VOC CEMS that meets the requirements of Section 6.6.1. Section 5.9.2.3 states that in lieu of installing and operating a CEMS for VOC, the operator may propose an alternate monitoring scheme for VOC’s. Gallo Glass Company previously received approval of an alternate monitoring scheme for VOC. The following conditions will be included on the Authority to Construct permit:

- The oxygen to fuel ratio shall be continuously monitored and recorded. [District Rule 4354]
- The permittee shall maintain the burner oxygen to fuel ratio records required by this permit. [District Rules 2201 and 4354]
• The oxygen to fuel ratio shall be maintained within the range shown by the most recent source test to result in compliance with the CO and VOC limits of this permit. The acceptable range of the oxygen to fuel ratio shall be established during the initial source test and during each subsequent annual source test.

Section 5.9.3.1 requires each furnace, subject to Section 5.3, to implement a SOx CEMS that meets the requirements of Section 6.6.1. The applicant is proposing the use of a SOx CEMS and compliance with this requirement is expected. Permit conditions outlining the CEMS requirements were included earlier in this evaluation.

Section 5.9.4.1 requires the operators to propose key system operating parameter(s) and frequency of monitoring and recording of those parameters, for PM10 monitoring. Gallo Glass Company previously received approval of an alternate monitoring scheme for PM10. The following conditions will be included on each Authority to Construct permit:

• Devices to measure the primary and secondary voltage and current of the electrostatic precipitator shall be maintained in accordance with the manufacturer's specifications. [District Rule 4354, 40 CFR 60.293(d) and 40 CFR Part 64]

• The specific power of the electrostatic precipitator shall be at least 70 milliwatts/acfm except during the bypass episodes allowed by this permit. [District Rule 2520, §9.3.2, 40 CFR 60.293(d), and 40 CFR Part 64] Y

• The ceramic filter dust collector shall be equipped with a pressure differential gauge to indicate the pressure drop across the filters. The gauge shall be maintained in good working condition at all times and shall be located in an easily accessible location. [District Rules 2201 and 4354 and 40 CFR Part 64] Y

• During operation of the ceramic filter dust collector, the pressure differential gauge reading shall be 5 to 10 inches of water column. [District Rules 2201 and 4354 and 40 CFR Part 64]

• The specific power of the electrostatic precipitator shall be continuously monitored and recorded. [District Rules 2201 and 4354, 40 CFR 60.293(d), and 40 CFR Part 64]

• The permittee shall maintain daily records of the specific power of the electrostatic precipitator (in milliwatts/acfm). [District Rules 2201, 4354, 40 CFR 60.293(d), and 40 CFR Part 64]

• The operator shall monitor and record the pressure differential gauge reading of the ceramic filter dust collector at least once during each day that the unit operates. [District Rules 2201 and 4354 and 40 CFR Part 64]
Section 5.10: Routine Maintenance of Add-On Emission Control Systems

Section 5.10 states that during routine maintenance of add-on emission control system a glass furnace is exempt from the emission requirements listed in Sections 5.1 through 5.4 if:

1. Routine maintenance in each calendar year does not exceed 144 hours total for all add-on controls.
2. Routine maintenance is conducted in a manner consistent with good air pollution control practices for minimizing emissions.

The following conditions will be included on the Authority to Construct permit:

- The amount of time that the furnace exhaust is not fully treated by a control device shall not exceed 144 hours per calendar year. [District Rules 2201 and 4354]
- A record of the cumulative annual number of hours that the emission control system is either fully or partially bypassed shall be kept. The record shall be updated at least weekly. [District Rules 2201 and 4354]

Section 6.1: Permitted Glass Production Capacity and Fuel Use Capacity

Section 6.1 states that on and after October 1, 2009, each glass melting furnace permit shall include the furnace's permitted glass production capacity in tons of glass pulled per day as a permit condition. A condition limiting the furnace #2 glass production was presented earlier in this evaluation. Compliance is expected with this requirement.

Section 6.2: Operation Records

Section 6.2 lists recordkeeping requirements that apply through December 31, 2010. This date has passed; therefore, Section 6.2 requirements are not applicable.

Section 6.3: Operation Records

Section 6.3.1 states that the applicant shall keep daily records of the following items:

6.3.1.1: Total hours of operation;
6.3.1.2: The quantity of glass pulled from each furnace;
6.3.1.3: NOx emission rate in lb/ton of glass pulled;
6.3.1.4: CO emission rate in lb/ton of glass pulled, if a CEMS is used;
6.3.1.5: VOC emission rate in lb/ton of glass pulled, if a CEMS is used;
6.3.1.6: SOx emission rate in lb/ton of glass pulled, if a CEMS is used;
6.3.1.7: PM10 emission rate in lb/ton of glass pulled, if a CEMS is used;
6.3.1.8: For container glass furnaces that are oxy-fuel fired:
   6.3.1.8.1: The weight of mixed color mix cullet used;
   6.3.1.8.2: The total amount of cullet used by weight; and
   6.3.1.8.3: The ratio expressed in percent of mixed color mix weight to total cullet weight
The applicant is proposing to keep the appropriate records for the applicable items of the items listed above. Therefore, compliance is expected. The following condition will be included on the Authority to Construct permit:

- A daily record of the hours of operation, the amount of glass pulled from the furnace (in tons), the NOx emissions (in lb/ton of glass pulled), the SOx emissions (in lb/ton of glass pulled), the weight of mixed color mix cullet used, the total amount of cullet used (by weight) and the ratio of the mixed color cullet weight to the total cullet weight (in percent). [District Rules 2201 and 4354]

Section 6.3.2 states that for pollutants monitored using an approved parametric monitoring arrangement, operators shall record the operating values of the key system operating parameters at the approved recording frequency. Compliance with this requirement is expected. The following condition will be included on the Authority to Construct permit:

- Permittee shall maintain records of the following: 1) Source tests and source test results, 2) the acceptable range for each approved key system operating parameter, as established during source tests, 3) The operating values of the key system operating parameters at the approved recording frequency, 4) any maintenance and repair, and 5) any malfunctions. [District Rule 4354]

Section 6.3.3 requires operators to keep the following records:

- Source tests and source test results
- The acceptable range for each approved key system operating parameter, as established during source test;
- Maintenance and repair; and
- Malfunction.

The applicant is proposing to keep the appropriate records for the items listed above. The condition listed above includes the requirement to keep these records.

Section 6.3.4 requires the operator to retain records specified in Sections 6.3.1 through 6.3.3 for a period of five years; make the records available on site during normal business hours to the APCO, ARB, or EPA; and submit the records to the APCO, ARB, or EPA upon request. Compliance with this requirement is expected. The following condition will be included on the Authority to Construct permit:

- All records shall be maintained and retained on-site for a period of at least 5 years and shall be made available for District inspection upon request. [District Rules 2201 and 4354 and 40 CFR Part 64]

Section 6.4: Compliance Source Testing

Section 6.4.1 requires each glass melting furnace or a furnace battery to be source tested at least once every calendar year, but not more than every 18 months and not sooner than every 6 months to demonstrate compliance with the applicable requirements of Section 5.0. Compliance with this requirement is expected. A permit condition enforcing this requirement was presented earlier in this evaluation.
Section 6.4.2 requires the source test conditions to be representative of normal operations, but not less than 60 percent of the permitted glass production capacity. The following condition will be included on the Authority to Construct permit:

- **Source test conditions shall be representative of operations equal to or greater than 60 percent of the fuel use capacity for each furnace as stated in the Permit to Operate. [District Rule 4354, §6.4.2]**

Section 6.4.3 requires operators using alternate monitoring systems to, during the source test, monitor and record, at a minimum, all operating data for each parameter, fresh feed rate, and flue gas flow rate and submit that data with the test report. Compliance with this requirement is expected.

Section 6.4.4 requires states that the arithmetic average of three 30-consecutive minute source test runs must be used to determine compliance with the NOx, CO, VOC, and SOx emission limits. Compliance with this requirement is expected. The following condition will be included on the Authority to Construct permit:

- **For source testing purposes, the arithmetic average of three 30-consecutive-minute test runs shall be used to determine compliance with NOx, CO, VOC, SOx, and NH3 emission limits. [District Rules 2201 and 4354]**

Section 6.4.5 requires states that the arithmetic average of three 60-consecutive minute source test runs must be used to determine compliance with the PM10 emission limits. Compliance with this requirement is expected. The following condition will be included on the Authority to Construct permit:

- **For source testing purposes, the arithmetic average of three 60-consecutive-minute test runs shall be used to determine compliance with PM10 emission limits. [District Rule 4354]**

Section 6.4.6 states that for a given pollutant, if two of the three runs individually demonstrate emission above the applicable limit, the test cannot be used to demonstrate compliance for the furnace, even if the averaged emissions of all three test runs is less than the applicable limit. The following condition will be included on the Authority to Construct permit:

- **For source testing purposes, if two of the three runs individually demonstrate emissions above the applicable limit, the test cannot be used to demonstrate compliance for the furnace, even if the averaged emissions of all three test runs is less than the applicable limit. [District Rule 4354]**

**Section 6.5: Test Methods**

Section 6.5 states that Compliance with the requirements of 5.0 shall be determined in accordance with the following source test procedures or their equivalents approved by the EPA, ARB, and the APCO:
<table>
<thead>
<tr>
<th>Pollutant/Parameter to be Measured</th>
<th>Test Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxides of Nitrogen</td>
<td>EPA Method 7E, EPA Method 19, or ARB Method 100</td>
</tr>
<tr>
<td>Carbon Monoxide (ppmv)</td>
<td>EPA Method 10 or ARB Method 100</td>
</tr>
<tr>
<td>Volatile Organic Compounds (ppmv)</td>
<td>EPA Method 25A expressed in terms of carbon, or ARB Method 100. EPA Method 18 or ARB method 422 shall be used to determine emissions of exempt compounds.</td>
</tr>
<tr>
<td>Stack Gas Oxygen, Carbon Dioxide, Excess Air, and Dry Molecular Weight</td>
<td>EPA Method 3 or 3A, or ARB Method 100</td>
</tr>
<tr>
<td>Stack Gas Velocity or Volumetric Flow Rate</td>

<td>EPA Method 5; EPA Method 201; or EPA Method 201A. An operator choosing EPA Method 5 shall count all PM as PM10.</td>
</tr>
<tr>
<td>Condensable PM10</td>
<td>EPA Method 202</td>
</tr>
</tbody>
</table>

A condition enforcing these requirements was included earlier in this evaluation.

**Section 6.6: Emission Monitoring Systems**

Section 6.6.1 states that an approved CEMS must comply with all of the following requirements:

2. 40 CFR Part 60.7 (Notification and Recordkeeping);
3. 40 CFR Part 60.13 (Monitoring Requirements);
4. 40 CFR Part 60 Appendix B (Performance Specifications);
5. 40 CFR Part 60 Appendix F (Quality Assurance Procedures);
6. and the applicable sections of District Rule 1080 (Stack Monitoring).

The NOx and SOx CEMS are expected to comply with the above requirements.

Section 6.6.2 states that an approved alternate emissions monitoring method must be capable of determining the furnace emissions on an hourly basis and must comply with the following requirements:

1. 40 CFR 64 (Compliance Assurance Monitoring); and
2. 40 CFR 60.13 (Monitoring Requirements).

The proposed CO, VOC, and PM10 alternate monitoring schemes will comply with the above requirements.
Section 6.7: Notification and Records for Start-up, Shutdown, and Idling

Section 6.7.1 states that the operator of any glass melting furnace claiming an exemption under Section 4.4 must notify the APCO by telephone at least 24 hours before initiating idling, shutdown, or start-up. The notification must include the date and time for the start of the exempt operation, reason for performing the operation, and an estimated completion date. The following condition will be included on the Authority to Construct permit:

- The emission limitations of District Rule 4354 shall not apply during periods of start-up, shutdown, and idling, as defined by District Rule 4354. The permittee shall notify the District at least 24 hours prior to initiating idling, shutdown, or startup of the glass furnace and this notification shall include: The date and time of the start of the exempt operation, reason for performing the operation, and an estimated completion date. The permittee shall notify the District by telephone within 24 hours after completion of the operation and shall maintain operating records and/or support documentation necessary to claim exemption. [District Rule 4354]

Section 6.8: Records for Exempt Furnaces

Section 6.8 of this rule applies to exempt furnaces. The furnace in this project is not exempt. Therefore, the requirements of Section 6.8 are not applicable.

Conclusion:

Compliance with all of the requirements of District Rule 4354 is expected.

District Rule 4801 Sulfur Compounds

Per Section 3.1, a person shall not discharge into the atmosphere sulfur compounds, which would exist as a liquid or gas at standard conditions, exceeding in concentration at the point of discharge: 0.2 % by volume (2000 ppmvd) calculated as SO₂ on a dry basis averaged over 15 consecutive minutes.

The furnaces were last source tested on May 30, 2013, and the furnaces were operating at 284.3 ppmvd SO₂. This project is not expected to increase the SO₂ concentration by a significant amount. Therefore, continued compliance is expected.
40 CFR Part 64 Compliance Assurance Monitoring

40 CFR Part 64 requires Compliance Assurance Monitoring (CAM) for units that meet the following three criteria:

1) the unit must have an emission limit for the pollutant;
2) the unit must have add-on controls for the pollutant; these are devices such as flue gas recirculation (FGR), baghouses, and catalytic oxidizers; and
3) the unit must have a pre-control potential to emit of greater than the major source thresholds.

The following Major Source thresholds will be used, as necessary, to determine whether CAM is triggered.

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>lb/year</th>
<th>ton/year</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td>20,000</td>
<td>10</td>
</tr>
<tr>
<td>SOx</td>
<td>140,000</td>
<td>70</td>
</tr>
<tr>
<td>PM10</td>
<td>140,000</td>
<td>70</td>
</tr>
<tr>
<td>CO</td>
<td>200,000</td>
<td>100</td>
</tr>
<tr>
<td>VOC</td>
<td>20,000</td>
<td>10</td>
</tr>
</tbody>
</table>

The facility is a Major Source for NOx, SOx, PM10 and VOC, therefore, a CAM determination must be performed for these pollutants.

NOx CAM Determination:

Pursuant to Section 64.2(b)(vi), emission limits or standards for which the permit specifies a continuous compliance determination method are exempt from CAM requirements. This glass furnace will be equipped with a Continuous Emission Monitoring System (CEMs) that directly measures NOx emissions. Therefore, the glass furnace is exempt from CAM requirements for NOx emissions.

SOx CAM Determination

Pursuant to Section 64.2(b)(vi), emission limits or standards for which the permit specifies a continuous compliance determination method are exempt from CAM requirements. This glass furnace will be equipped with a Continuous Emission Monitoring System (CEMs) that directly measures SOx emissions. Therefore, the glass furnace is exempt from CAM requirements for SOx emissions.
PM10 CAM Determination

The current permit includes CAM monitoring requirements for PM10. Those monitoring requirements, shown below, will be retained on the ATC.

- **Devices to measure the primary and secondary voltage and current of the electrostatic precipitator shall be maintained in accordance with the manufacturer’s specifications.** [District Rule 4354 and 40 CFR Part 64]

- **The specific power of the electrostatic precipitator shall be at least 70 milliwatts/acfm except during the bypass episodes allowed by this permit.** [District Rule 2520, §9.3.2 and 40 CFR Part 64]

- **The ceramic filter dust collector shall be equipped with a pressure differential gauge to indicate the pressure drop across the filters. The gauge shall be maintained in good working condition at all times and shall be located in an easily accessible location.** [District Rules 2201 and 4354 and 40 CFR Part 64]

- **During operation of the ceramic filter dust collector, the pressure differential gauge reading shall be 5 to 10 inches of water column.** [District Rules 2201 and 4354 and 40 CFR Part 64]

- **The specific power of the electrostatic precipitator shall be continuously monitored and recorded.** [District Rules 2201 and 4354 and 40 CFR Part 64]

- **The permittee shall maintain daily records of the specific power of the electrostatic precipitator (in milliwatts/acfm).** [District Rules 2201, 4354 and 40 CFR Part 64]

- **The operator shall monitor and record the pressure differential gauge reading of the ceramic filter dust collector at least once during each day that the unit operates.** [District Rules 2201 and 4354 and 40 CFR Part 64]

VOC CAM Determination

This unit is not equipped with an add-on control device for VOC emissions. Therefore, the unit is not subject to CAM for VOC emissions.

California Environmental Quality Act (CEQA)

CEQA requires each public agency to adopt objectives, criteria, and specific procedures consistent with CEQA Statutes and the CEQA Guidelines for administering its responsibilities under CEQA, including the orderly evaluation of projects and preparation of environmental documents. The District adopted its *Environmental Review Guidelines* (ERG) in 2001. The basic purposes of CEQA are to:

- Inform governmental decision-makers and the public about the potential, significant environmental effects of proposed activities;
- Identify the ways that environmental damage can be avoided or significantly reduced;
• Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible; and

• Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

Greenhouse Gas (GHG) Significance Determination

It is determined that no other agency has prepared or will prepare an environmental review document for the project. Thus the District is the Lead Agency for this project.

On December 17, 2009, the District's Governing Board adopted a policy, APR 2005, Addressing GHG Emission Impacts for Stationary Source Projects Under CEQA When Serving as the Lead Agency, for addressing GHG emission impacts when the District is Lead Agency under CEQA and approved the District's guidance document for use by other agencies when addressing GHG impacts as lead agencies under CEQA. Under this policy, the District’s determination of significance of project-specific GHG emissions is founded on the principal that projects with GHG emission reductions consistent with AB 32 emission reduction targets are considered to have a less than significant impact on global climate change. Consistent with District Policy 2005, projects complying with an approved GHG emission reduction plan or GHG mitigation program, which avoids or substantially reduces GHG emissions within the geographic area in which the project is located, would be determined to have a less than significant individual and cumulative impact for GHG emission.

The California Air Resources Board (ARB) adopted a Cap-and-Trade regulation as part one of the strategies identified for AB 32. This Cap-and-Trade regulation is a statewide plan, supported by a CEQA compliant environmental review document, aimed at reducing or mitigating GHG emissions from targeted industries. Facilities subject to the Cap-and-Trade regulation are subject to an industry-wide cap on overall GHG emissions. Any growth in emissions must be accounted for under that cap such that a corresponding and equivalent reduction in emissions must occur to allow any increase. Further, the cap decreases over time, resulting in an overall decrease in GHG emissions.

Under District policy APR 2025, CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation, the District finds that the Cap-and-Trade is a regulation plan approved by ARB, consistent with AB32 emission reduction targets, and supported by a CEQA compliant environmental review document. As such, consistent with District Policy 2005, projects complying project complying with Cap-and-Trade requirements are determined to have a less than significant individual and cumulative impact for GHG emissions.

Facility N-1662 is subject to the Cap-and-Trade regulation. Therefore, as discussed above, consistent with District Policies APR 2005 and APR 2025, the District concludes that the GHG emissions increases associated with this project would have a less than significant individual and cumulative impact on global climate change.
District CEQA Findings

The District is the Lead Agency for this project because there is no other agency with broader statutory authority over this project. The District performed an Engineering Evaluation (this document) for the proposed project and determined that the activity will occur at an existing facility and the project involves negligible expansion of the existing use. Furthermore, the District determined that the activity will not have a significant effect on the environment. The District finds that the activity is categorically exempt from the provisions of CEQA pursuant to CEQA Guideline § 15301 (Existing Facilities), and finds that the project is exempt per the general rule that CEQA applies only to projects which have the potential for causing a significant effect on the environment (CEQA Guidelines §15061(b)(3)).

IX. Recommendation

Compliance with all applicable rules and regulations is expected. Issue Authority to Construct permit N-1662-2-17 subject to the permit conditions on the attached draft Authority to Construct permit in Appendix I.

Draft Authority to Construct Permit
San Joaquin Valley
Air Pollution Control District

AUTHORITY TO CONSTRUCT

PERMIT NO: N-1662-2-17
LEGAL OWNER OR OPERATOR: GALLO GLASS COMPANY
MAILING ADDRESS:
PO BOX 1230
MODESTO, CA 95353
LOCATION:
605 S SANTA CRUZ AVE
MODESTO, CA 95354

EQUIPMENT DESCRIPTION:
MODIFICATION OF GLASS FURNACE #2 WITH 12 GAS/OXYGEN BURNERS AND ASSOCIATED FORMING EQUIPMENT (80 MMIBTU/HR MAX HEAT CAPACITY). THIS FURNACE IS DUCTED THROUGH A STACK COMMON TO PERMIT UNITS N-1662-1, N-1662-2, N-1662-3 AND N-1662-4. THE FURNACES ARE SERVED BY A SHARED SOX SCRUBBER AND AN ELECTROSTATIC PRECIPITATOR AND/OR A TRI-MER UTF460 CERAMIC FILTER TYPE DUST COLLECTOR. TO REBRICK THE FURNACE, TO REMOVE TWO 2.5 MMIBTU/HR BURNERS, TO EXPAND THE FOOTPRINT OF THE FURNACE TO 1425 SQUARE FEET, TO INCREASE THE FURNACE PRODUCTION CAPACITY TO 430 TONS OF GLASS PULLED PER DAY, TO LIMIT NOX EMISSIONS TO 1.3 LB/TON OF GLASS PULLED, TO LIMIT CO EMISSIONS TO 0.2 LB/TON OF GLASS PULLED, AND TO LIMIT VOC EMISSIONS TO 0.01 LB/TON OF GLASS PULLED. POST-PROJECT EQUIPMENT DESCRIPTION: GLASS FURNACE #2 WITH 10 MAXON GAS/OXYGEN BURNERS (OR EQUIVALENT) AND ASSOCIATED FORMING EQUIPMENT (75 MMIBTU/HR MAX HEAT CAPACITY). THIS FURNACE IS DUCTED THROUGH A STACK COMMON TO PERMIT UNITS N-1662-1, N-1662-2, N-1662-3 AND N-1662-4. THE FURNACES ARE SERVED BY A SHARED SOX SCRUBBER AND AN ELECTROSTATIC PRECIPITATOR AND/OR A TRI-MER UTF460 CERAMIC FILTER TYPE DUST COLLECTOR, AND A FURNACE CHARGING AREA SERVED BY TWO DUST COLLECTORS.

CONDITIONS

1. This Authority to Construct serves as a written certificate of conformity with the procedural requirements of 40 CFR 70.7 and 70.8 and with the compliance requirements of 40 CFR 70.6(e). [District Rule 2201] Federally Enforceable Through Title V Permit

2. Prior to operating with modifications authorized by this Authority to Construct, the facility shall submit an application to modify the Title V permit with an administrative amendment in accordance with District Rule 2520 Section 5.3.4. [District Rule 2520, 5.3.4] Federally Enforceable Through Title V Permit

CONDITIONS CONTINUE ON NEXT PAGE

YOU MUST NOTIFY THE DISTRICT COMPLIANCE DIVISION AT (209) 557-6400 WHEN CONSTRUCTION IS COMPLETED AND PRIOR TO OPERATING THE EQUIPMENT OR MODIFICATIONS AUTHORIZED BY THIS AUTHORITY TO CONSTRUCT. This is NOT a PERMIT TO OPERATE. Approval or denial of a PERMIT TO OPERATE will be made after an inspection to verify that the equipment has been constructed in accordance with the approved plans, specifications and conditions of this Authority to Construct, and to determine if the equipment can be operated in compliance with all Rules and Regulations of the San Joaquin Valley Unified Air Pollution Control District. Unless construction has commenced pursuant to Rule 2050, this Authority to Construct shall expire and application shall be cancelled two years from the date of issuance. The applicant is responsible for complying with all laws, ordinances and regulations of all other governmental agencies which may pertain to the above equipment.

Seyed Sadredin, Executive Director, APCO

Arnaud Marjolle, Director of Permit Services

Northern Regional Office • 4800 Enterprise Way • Modesto, CA 95356-8718 • (209) 557-6400 • Fax (209) 557-6475
3. Prior to operating equipment under this Authority to Construct, permittee shall surrender NOx emission reduction credits for the following quantity of emissions (not including the offset ratio): 1st quarter - 5,945 lb, 2nd quarter - 6,011 lb, 3rd quarter - 6,078 lb, and 4th quarter - 6,078 lb. Offsets shall be provided at an offset ratio 1.5 to 1. [District Rule 2201] Federally Enforceable Through Title V Permit

4. Prior to operating equipment under this Authority to Construct, permittee shall surrender SOx emission reduction credits for the following quantity of emissions (not including the offset ratio): 1st quarter - 6,941 lb, 2nd quarter - 7,018 lb, 3rd quarter - 7,095 lb, and 4th quarter - 7,096 lb. Offsets shall be provided at the applicable offset ratio specified in District Rule 2201 (as amended 4/21/11). [District Rule 2201] Federally Enforceable Through Title V Permit

5. Prior to operating equipment under this Authority to Construct, permittee shall surrender PM10 emission reduction credits for the following quantity of emissions (not including the offset ratio): 1st quarter - 3,185 lb, 2nd quarter - 3,220 lb, 3rd quarter - 3,255 lb, and 4th quarter - 3,256 lb. Offsets shall be provided at the applicable offset ratio specified in District Rule 2201 (as amended 4/21/11). [District Rule 2201] Federally Enforceable Through Title V Permit

6. ERC certificates N-768-2, S-4214-5, S-4215-5, C-1280-5, C-1281-5, and N-I61-4 (or a certificate split from these certificates) shall be used to supply the required offsets, unless a revised offsetting proposal is received and approved by the District, upon which this Authority to Construct shall be reissued, administratively specifying the new offsetting proposal. Original public noticing requirements, if any, shall be duplicated prior to reissuance of this Authority to Construct. [District Rule 2201] Federally Enforceable Through Title V Permit

7. No air contaminants shall be discharged into the atmosphere for a period or periods aggregating more than 3 minutes in any one hour which is as dark or darker than Ringelmann No. 1 or equivalent to 20% opacity and greater, unless specifically exempted by District Rule 4101 (02/17/05). If the equipment or operation is subject to a more stringent visible emission standard as prescribed in a permit condition, the more stringent visible emission limit shall supersede this condition. [District Rule 4101, and County Rules 401 (in all eight counties in the San Joaquin Valley)] Federally Enforceable Through Title V Permit

8. No air contaminant shall be released into the atmosphere which causes a public nuisance. [District Rule 4102]

9. Particulate matter emissions shall not exceed 0.1 grain/dscf in concentration. [District Rule 4201 and Stanislaus County Rule 404] Federally Enforceable Through Title V Permit

10. The furnace shall be fired on natural gas and LPG only. [District NSR Rule] Federally Enforceable Through Title V Permit

11. The furnace shall have continuous monitoring systems for NOx and SOx. The monitoring devices shall have continuous recording devices, and all records shall be kept on site. [District Rules 1080 and 4354, §5.9] Federally Enforceable Through Title V Permit

12. One continuous emissions monitoring (CEM) system may be used for monitoring oxy-fuel fired furnaces #1, #2, #3, and #4 provided all of the exhaust gases of each of these furnaces are ducted to a common stack, and monitored down stream of the common stack. The CEMS shall comply with the requirements of 40 Code of Federal Regulations (CFR) Part 51, 40 CFR Parts 60.7 and 60.13, 40 CFR Part 60 Appendix B (Performance Specifications) and Appendix F (Quality Assurance Procedures) and the applicable sections of Rule 1080 (Stack Monitoring). [District Rule 4354, §5.9 and 6.6.1] Federally Enforceable Through Title V Permit

13. The facility shall install and maintain equipment, facilities, and systems compatible with the District's CEM data polling software system and shall make CEM data available to the District's automated polling system on a daily basis. [District Rule 1080] Federally Enforceable Through Title V Permit

14. The common exhaust stack shall be equipped with permanent provisions to allow collection of stack gas samples consistent with EPA test methods and shall be equipped with safe permanent provisions to sample stack gases with a portable NOx, CO, and O2 analyzer during District inspections. The sampling ports shall be located in accordance with the CARB regulation titled California Air Resources Board Air Monitoring Quality Assurance Volume VI, Standard Operating Procedures for Stationary Source Emission Monitoring and Testing. [District Rule 1081] Federally Enforceable Through Title V Permit

CONDITIONS CONTINUE ON NEXT PAGE
15. The emission limitations of District Rule 4354 shall not apply during periods of start-up, shutdown, and idling, as defined by District Rule 4354. The permittee shall notify the District at least 24 hours prior to initiating idling, shutdown, or startup of the glass furnace and this notification shall include: The date and time of the start of the exempt operation, reason for performing the operation, and an estimated completion date. The permittee shall notify the District by telephone within 24 hours after completion of the operation and shall maintain operating records and/or support documentation necessary to claim exemption. [District Rule 4354] Federally Enforceable Through Title V Permit

16. During startups, the permittee shall comply with the requirements of section 5.5 of District Rule 4354. [District Rule 4354, §5.5] Federally Enforceable Through Title V Permit

17. The startup exemption time period shall not exceed 18 days, beginning from the time of primary combustion system activation. [District Rule 4354] Federally Enforceable Through Title V Permit

18. During start-up period, the stoichiometric ratio of the primary furnace combustion system shall not exceed 5% excess oxygen, as calculated from the actual fuel and oxidant flow measurements for combustion in the furnace, except during the time when the oxidant stream for an oxy-fuel fired furnace contains at least 50% oxygen. [District Rule 4354] Federally Enforceable Through Title V Permit

19. The emission control systems shall be in operation whenever conditions are consistent with equipment manufacturer’s specifications during startup, idling and shutdown periods. [District Rule 4354] Federally Enforceable Through Title V Permit

20. The duration of a furnace shutdown shall not exceed 20 days, measured from the time furnace operations drop below the idle threshold specified in Section 3.17 of District Rule 4354 to when all emissions from the furnace cease. [District Rule 4354] Federally Enforceable Through Title V Permit

21. NOx, CO, VOC, SOx, and PM10 emissions during idling shall not exceed the amount as calculated using the following equation: NOx, CO, VOC, SOx, or PM10 (lb/day) = Applicable emission limit (lb/ton) x Furnace permitted production capacity (tons/day). [District Rule 4354] Federally Enforceable Through Title V Permit

22. The oxygen to fuel ratio shall be maintained within the range shown by the most recent source test to result in compliance with the CO and VOC limits of this permit. The acceptable range of the oxygen to fuel ratio shall be established during the initial source test and during each subsequent annual source test. [District Rule 4354] Federally Enforceable Through Title V Permit

23. Particulate matter emissions shall not exceed the hourly rate as calculated in District Rule 4202 using the equation E=3.59P^0.62 (P< 30 tph) or E=17.31P^0.16 (P> 30 tph). [District Rule 4202] Federally Enforceable Through Title V Permit

24. Sulfur compound emissions shall not exceed 0.2% by volume, 2000 ppmv, on a dry basis averaged over 15 consecutive minutes. [Stanislaus County Rule 407 and District Rule 4801] Federally Enforceable Through Title V Permit

25. Source testing to demonstrate compliance with permit conditions and all rules and regulations for both natural gas and LPG shall be conducted within 60 days after the end of the start-up exemption, and at least once every calendar year thereafter. NOx and CO testing shall be performed using CARB Method 100. VOC testing shall be performed using EPA method 25A. PM10 testing shall be performed using EPA methods 201 and 202, EPA methods 201a and 202, or CARB methods 501 and 5. SOx testing shall be performed using EPA Method 8 and CARB Method 1-100. [District Rules 1081, 2201, 2520, §9.3.2; and 4354, 6.4 and 6.5] Federally Enforceable Through Title V Permit

26. Source testing when firing on LPG fuel need not be performed if the LPG fuel usage for this furnace does not exceed 100 hours during any one calendar year. A source test shall be performed within 90 days after this furnace exceeds 100 hours of operation, on LPG, on an annual basis. [District Rule 1081] Federally Enforceable Through Title V Permit

27. Source testing shall be conducted by a CARB-certified source testing contractor. Source testing shall be conducted using the methods and procedures approved by the District. The District must be notified 30 days prior to any compliance source test, and a source test plan must be submitted for approval at least 15 days prior to source testing. The results of each source test shall be submitted to the District within 60 days after the source test date. [District Rule 1081] Federally Enforceable Through Title V Permit
28. Source test conditions shall be representative of operations equal to or greater than 60 percent of the fuel use capacity for each furnace as stated in the Permit to Operate. [District Rule 4354, §6.4.2] Federally Enforceable Through Title V Permit

29. For source testing purposes, the arithmetic average of three 30-consecutive-minute test runs shall be used to determine compliance with NOx, CO, VOC, SOx, and NH3 emission limits. [District Rule 4354] Federally Enforceable Through Title V Permit

30. For source testing purposes, the arithmetic average of three 60-consecutive-minute test runs shall be used to determine compliance with PM10 emission limits. [District Rule 4354] Federally Enforceable Through Title V Permit

31. For source testing purposes, if two of the three runs individually demonstrate emissions above the applicable limit, the test cannot be used to demonstrate compliance for the furnace, even if the averaged emissions of all three test runs is less than the applicable limit. [District Rule 4354] Federally Enforceable Through Title V Permit

32. PM and PM10 source testing shall be conducted downstream of the electrostatic precipitator and the ceramic filter dust collector in the common stack. Furnaces #1, #2, #3, and #4 must operate simultaneously during source testing unless prior approval is obtained from the District. [District Rule 1081] Federally Enforceable Through Title V Permit

33. An annual Relative Accuracy Test Audit (RATA) shall be performed on the continuous monitoring system as outlined in 40 CFR Part 60 Appendix B. [District Rule 1080] Federally Enforceable Through Title V Permit

34. The owner/operator shall perform a relative accuracy test audit (RATA) as specified by 40 CFR Part 60, Appendix F (CGAs and RATAs) and if applicable 40 CFR Part 75, Appendix B (linearity and RATAs) at least once every four calendar quarters and annually within 30 days of the anniversary date of the initial test. The permittee shall comply with the applicable requirements for quality assurance testing and maintenance of the continuous emission monitor equipment in accordance with the procedures and guidance specified in 40 CFR Part 60, Appendix F. [District Rule 1080] Federally Enforceable Through Title V Permit

35. An exceedance of a NOx or SOx emission limit as indicated by the CEMS shall be reported by the operator to the APCO within 24 hours. The notification shall include 1) name and location of the facility, 2) identification of furnace(s) causing the exceedances, 3) calculation of actual NOx, CO and VOC emissions, and 4) corrective actions and schedules to complete the work. [District Rule 1080 and Stanislaus County Rule 1080] Federally Enforceable Through Title V Permit

36. {2251} The owner or operator shall, upon written notice from the APCO, provide a summary of the data obtained from the CEM systems. This summary of data shall be in the form and the manner prescribed by the APCO. [District Rule 1080, 7.1] Federally Enforceable Through Title V Permit

37. Records shall be maintained and shall include: the occurrence and duration of any start-up, shutdown or malfunction, performance testing, evaluations, calibrations, checks, adjustments, any periods during which a continuous monitoring system or monitoring device is inoperative, maintenance of any CEMS that have been installed pursuant to District Rule 1080, and emission measurements. [District Rule 1080] Federally Enforceable Through Title V Permit

38. The operator shall notify the APCO no later than one hour after the detection of a breakdown of the CEMS. The operator shall inform the APCO of the intent to shut down the CEMS at least 24 hours prior to the event. [District Rule 1100] Federally Enforceable Through Title V Permit

39. The permittee shall submit a written report including copies of any Equipment Breakdown reports and/or pertinent variance decisions to the APCO for each calendar quarter, within 30 days of the end of the quarter, including: time intervals, data and magnitude of excess emissions, nature and cause of excess emissions (if known), corrective actions taken and preventive measures adopted; averaging period used for data reporting shall correspond to the averaging period for each respective emission standard; applicable time and date of each period during which the CEM was inoperative (except for zero and span checks) and the nature of system repairs and adjustments; and a negative declaration when no excess emissions occurred. [District Rule 1080] Federally Enforceable Through Title V Permit

40. Upon notice by the District that the facility's CEM system is not providing polling data, the facility may continue to operate without providing automated data for a maximum of 10 days per calendar year provided the CEM data is sent to the District by a District-approved alternative method. [District Rule 1080] Federally Enforceable Through Title V Permit

CONDITIONS CONTINUE ON NEXT PAGE
41. Results of continuous emissions monitoring shall be reduced according to the procedure established in 40 CFR, Part 51, Appendix P, paragraphs 5.0 through 5.3.3, or by other methods deemed equivalent by mutual agreement with the District, the ARB, and the EPA. [District Rule 1080] Federally Enforceable Through Title V Permit

42. Cylinder gas audits (CGAs) of continuous emission monitors shall be conducted quarterly, except during quarters in which relative accuracy and total accuracy testing is performed, in accordance with EPA guidelines. The District shall be notified prior to completion of the audits. Audit reports shall be submitted along with quarterly compliance reports to the District. [District Rule 1080] Federally Enforceable Through Title V Permit

43. Compliance with the conditions in the permit requirements for this unit shall be deemed compliance with District Rule 4201, Stanislaus County Rule 404, District Rule 4202 and Stanislaus County Rule 405. A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

44. Compliance with the conditions in the permit requirements for this unit shall be deemed compliance with District Rule 4201 and Stanislaus County Rule 407. A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

45. The requirements of District Rule 4301 and Stanislaus County Rule 408 were determined to not apply to this unit because the unit does not utilize indirect heat transfer. A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

46. The requirements of 40 CFR Part 61, Subpart N were determined to not apply to this unit because the unit does not use commercial arsenic. A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

48. The quantity of glass produced shall not exceed 430 tons during any one day. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

49. NOx emissions shall not exceed 1.3 pounds per ton of glass produced (over a rolling 30-day average). This performance based limit is to enforce the NOx emission reductions granted by certificate number N-54-2. [District NSR Rule] Federally Enforceable Through Title V Permit

50. CO emissions shall not exceed 0.2 pounds per ton of glass produced. [District NSR Rule] Federally Enforceable Through Title V Permit

51. The VOC emissions shall not exceed 0.01 pounds per ton of glass produced. [District Rule 2201] Federally Enforceable Through Title V Permit

52. The combined SOx emissions from permit units N-1662-1, N-1662-2, N-1662-3 and N-1662-4, while producing glass with equal to or greater than 25% by weight mixed color cullet, shall not exceed 0.99 lb/ton of glass produced (over a rolling 30 day average). [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

53. The combined SOx emissions from permit units N-1662-1, N-1662-2, N-1662-3 and N-1662-4, while producing glass with less than 25% by weight mixed color cullet, shall not exceed 0.81 lb/ton of glass produced (over a rolling 30 day average). [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

54. The PM10 emissions, except during full or partial emission control system bypass episodes, shall not exceed 0.45 lb/ton of glass produced. [District NSR Rules 2201 and 4354] Federally Enforceable Through Title V Permit

55. The PM10 emissions, during full or partial emission control system bypass episodes, shall not exceed 0.71 lb/ton of glass produced. [District Rule 2201] Federally Enforceable Through Title V Permit

56. PM emissions from the glass furnace shall not exceed 1 gram of particulate matter per kilogram of glass produced. [40 CFR 60.293(b)(2)] Federally Enforceable Through Title V Permit

57. The amount of time that the furnace exhaust is not fully treated by a control device shall not exceed 144 hours per calendar year. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit
58. The PM10 emissions shall not exceed 18,712 pounds during the first calendar quarter, 18,919 pounds during the second calendar quarter, 19,127 pounds during the third calendar quarter and 19,128 pounds during the fourth calendar quarter. These limits are to enforce the PM10 emission reductions granted by certificate number N-161-4. [District NSR Rule] Federally Enforceable Through Title V Permit

59. The facility shall not use commercial arsenic as a raw material in the production process. [40 CFR Part 61 Subpart N] Federally Enforceable Through Title V Permit

60. Each dust collector shall be maintained and operated in the range that optimizes control efficiency as recommended by the manufacturer. [District Rule 2201] Federally Enforceable Through Title V Permit

61. Each dust collectors cleaning frequency and duration shall be adjusted to optimize the control efficiency. [District Rule 2201] Federally Enforceable Through Title V Permit

62. Material removed from each dust collector shall be disposed of in a manner preventing entrainment into the atmosphere. [District Rule 2201] Federally Enforceable Through Title V Permit

63. Replacement filters numbering at least 10% of the total number of filters in the largest dust collector, and for each type of filter, shall be maintained on the premises. [District Rule 2201] Federally Enforceable Through Title V Permit

64. Devices to measure the primary and secondary voltage and current of the electrostatic precipitator shall be maintained in accordance with the manufacturer's specifications. [District Rule 4354, 40 CFR 60.293(d) and 40 CFR Part 64] Federally Enforceable Through Title V Permit

65. The specific power of the electrostatic precipitator shall be at least 70 milliwatts/acfm except during the bypass episodes allowed by this permit. [District Rule 2520, §9.3.2, 40 CFR 60.293(d), and 40 CFR Part 64] Federally Enforceable Through Title V Permit

66. The ceramic filter dust collector shall be equipped with a pressure differential gauge to indicate the pressure drop across the filters. The gauge shall be maintained in good working condition at all times and shall be located in an easily accessible location. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

67. Each of the furnace dust collectors shall be equipped with a pressure differential gauge to indicate the pressure drop across the filters. The gauge shall be maintained in good working condition at all times and shall be located in an easily accessible location. [District Rule 2201] Federally Enforceable Through Title V Permit

68. During operation of the ceramic filter dust collector, the pressure differential gauge reading shall be 5 to 10 inches of water column. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

69. During operation of the furnace charger dust collectors, the pressure differential gauge reading for each dust collector shall be 2 to 8 inches of water column. [District Rule 2201] Federally Enforceable Through Title V Permit

70. The permittee shall comply with the compliance assurance monitoring operation and maintenance requirements of 40 CFR Part 64.7. [40 CFR Part 64] Federally Enforceable Through Title V Permit

71. If the District or EPA determine that a Quality Improvement Plan is required under 40 CFR Part 64.7(d)(2), the permittee shall develop and implement the Quality Improvement Plan in accordance with 40 CFR Part 64.8. [40 CFR Part 64] Federally Enforceable Through Title V Permit

72. The permittee shall comply with the record keeping and reporting requirements of 40 CFR Part 64.9. [40 CFR Part 64] Federally Enforceable Through Title V Permit

73. The specific power of the electrostatic precipitator shall be continuously monitored and recorded. [District Rules 2201 and 4354, 40 CFR 60.293(d), and 40 CFR Part 64] Federally Enforceable Through Title V Permit

74. Dust collector filters shall be inspected annually while in operation for evidence of particulate matter breakthrough and replaced as needed. [District Rule 2520, 9.4.2] Federally Enforceable Through Title V Permit

75. Dust collector filters shall be inspected annually while not in operation for tears, scuffs, abrasions or hole that might interfere with the PM collection efficiency and shall be replaced as needed. [District Rule 2520, 9.4.2] Federally Enforceable Through Title V Permit
76. Permittee shall keep a record of the daily hours of operation, the amount of glass pulled from the furnace (in tons), the 
NOx emissions (in lb/ton of glass pulled), the SOx emissions (in lb/ton of glass pulled), the weight of mixed color mix 
cullet used, the total amount of cullet used (by weight) and the ratio of the mixed color cullet weight to the total cullet 
weight (in percent). [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

77. Permittee shall maintain records of the following: 1) Source tests and source test results, 2) the acceptable range for 
each approved key system operating parameter, as established during source tests, 3) The operating values of the key 
system operating parameters at the approved recording frequency, 4) any maintenance and repair, and 5) any 
malfunctions. [District Rule 4354] Federally Enforceable Through Title V Permit

78. The oxygen to fuel ratio shall be continuously monitored and recorded. [District Rule 4354] Federally Enforceable 
Through Title V Permit

79. The permittee shall maintain daily records of the aggregated NOx emissions. [District Rules 2520, 9.3.2 and 4354, 
9.6.1 and 9.7] Federally Enforceable Through Title V Permit

80. The permittee shall maintain the burner oxygen to fuel ratio records required by this permit. [District Rules 2201 and 
4354] Federally Enforceable Through Title V Permit

81. A record of the PM10 emissions from this unit, in pounds per calendar quarter, shall be kept. [District Rule 2201] 
Federally Enforceable Through Title V Permit

82. A record of the cumulative annual number of hours that the emission control system is either fully or partially 
bypassed shall be kept. The record shall be updated at least weekly. [District Rules 2201 and 4354] Federally 
Enforceable Through Title V Permit

83. The permittee shall keep a record of the cumulative annual hours of operation of the glass furnace on LPG fuel. 
[District Rule 2201] Federally Enforceable Through Title V Permit

84. The permittee shall maintain daily records of the specific power of the electrostatic precipitator (in milliwatts/acfin). 
[District Rules 2201, 4354, 40 CFR 60.293(d), and 40 CFR Part 64] Federally Enforceable Through Title V Permit

85. The operator shall monitor and record the pressure differential gauge reading of the ceramic filter dust collector at least 
one per day that the unit operates. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable 
Through Title V Permit

86. Records of dust collector maintenance, inspections and repairs shall be maintained. The records shall include, date of 
inspection, change outs of filter media, corrective action taken, and identification of the individual performing the 
inspection. [District Rules 2201 and 2520, 9.4.2] Federally Enforceable Through Title V Permit

87. The permittee shall maintain records of the actual NO2, PM10, and PM emissions from this unit for each 12 
consecutive-month rolling period for a period of 10 years beginning on the date the unit starts operation under this 
permit for the purposes of demonstrating that there has not been a PSD "significant net emissions increase" above the 
baseline actual NO2, PM10, and PM emission levels reported under project N-1141107. The actual net emissions 
increase shall be calculated in accordance with 40 CFR 52.21 (June 16, 2011 version). If a significant net emissions 
increase for NO2, PM10, and PM emissions occurs during any 12 consecutive month period in the 10 year 
recordkeeping period, the permittee shall submit a permit application to modify the permit to meet the Prevention of 
Significant Deterioration requirements that were avoided under project N1141107, which are the public notice and 
modeling requirements of 40 CFR 52.21 (June 16, 2011 version). [District Rule 2201] Federally Enforceable Through 
Title V Permit

88. All records shall be maintained and retained on-site for a period of at least 5 years and shall be made available for 
District inspection upon request. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable Through 
Title V Permit
APPENDIX II

Current Permit to Operate
PERMIT UNIT REQUIREMENTS

1. Particulate matter emissions shall not exceed 0.1 grain/dscf in concentration. [District Rule 4201 and Stanislaus County Rule 404] Federally Enforceable Through Title V Permit

2. The furnace shall be fired on natural gas and LPG only. [District NSR Rule] Federally Enforceable Through Title V Permit

3. The furnace shall have continuous monitoring systems for NOx and SOx. The monitoring devices shall have continuous recording devices, and all records shall be kept on site. [District Rules 1080 and 4354, §5.9] Federally Enforceable Through Title V Permit

4. One continuous emissions monitoring (CEM) system may be used for monitoring oxy-fuel fired furnaces #1, #2, #3, and #4 provided all of the exhaust gases of each of these furnaces are ducted to a common stack, and monitored down stream of the common stack. The CEMS shall comply with the requirements of 40 Code of Federal Regulations (CFR) Part 51, 40 CFR Parts 60.7 and 60.13, 40 CFR Part 60 Appendix B (Performance Specifications) and Appendix F (Quality Assurance Procedures) and the applicable sections of Rule 1080 (Stack Monitoring). [District Rule 4354, 5.9 and 6.6.1] Federally Enforceable Through Title V Permit

5. The facility shall install and maintain equipment, facilities, and systems compatible with the District's CEM data polling software system and shall make CEM data available to the District's automated polling system on a daily basis. [District Rule 1080] Federally Enforceable Through Title V Permit

6. The exhaust stack shall be equipped with permanent provisions to allow collection of stack gas samples consistent with EPA test methods and shall be equipped with safe permanent provisions to sample stack gases with a portable NOx, CO, and O2 analyzer during District inspections. The sampling ports shall be located in accordance with the CARB regulation titled California Air Resources Board Air Monitoring Quality Assurance Volume VI, Standard Operating Procedures for Stationary Source Emission Monitoring and Testing. [District Rule 1081] Federally Enforceable Through Title V Permit

7. During startups, the permittee shall comply with the requirements of section 5.5 of District Rule 4354. [District Rule 4354, §5.5] Federally Enforceable Through Title V Permit

8. The NOx control system shall be in operation as soon as technologically feasible during the startup period to minimize emissions. [District Rule 4354, §5.5.6] Federally Enforceable Through Title V Permit

9. The NOx control system shall be in operation whenever technologically feasible during shutdown to minimize emissions. [District Rule 4354, §5.6.2] Federally Enforceable Through Title V Permit

10. The NOx control system shall be in operation whenever technologically feasible during furnace idling to minimize emissions. [District Rule 4354, §5.7.1] Federally Enforceable Through Title V Permit

PERMIT UNIT REQUIREMENTS CONTINUE ON NEXT PAGE
11. The duration of shutdown, as measured from the time the furnace operations drop below the idle threshold specified in section 3.17 of District Rule 4354 to when all emissions from the furnace cease, shall not exceed 20 days. [District Rule 4354, §5.6.1] Federally Enforceable Through Title V Permit

12. The oxygen to fuel ratio shall be maintained within the range shown by the most recent source test to result in compliance with the CO and VOC limits of this permit. The acceptable range of the oxygen to fuel ratio shall be established during the initial source test and during each subsequent annual source test. [District Rule 4354] Federally Enforceable Through Title V Permit

13. Particulate matter emissions shall not exceed the hourly rate as calculated in District Rule 4202 using the equation $E=3.59P^{0.62}$ (P< 30 tph) or $E=17.31P^{0.16}$ (P> 30 tph). [District Rule 4202] Federally Enforceable Through Title V Permit

14. Sulfur compound emissions shall not exceed 0.2% by volume, 2000 ppmv, on a dry basis averaged over 15 consecutive minutes. [Stanislaus County Rule 407 and District Rule 4801] Federally Enforceable Through Title V Permit

15. Source testing to demonstrate compliance with permit conditions and all rules and regulations for both natural gas and LPG shall be conducted at least once every calendar year. NOx and CO testing shall be performed using CARB Method 100. VOC testing shall be performed using EPA method 25A. PM10 testing shall be performed using EPA methods 201 and 202, EPA methods 201a and 202, or CARB methods 501 and 5. SOx testing shall be performed using EPA Method 8 and CARB Method 1-100. [District Rules 1081, 2201, 2520, §9.3.2; and 4354, 6.4 and 6.5] Federally Enforceable Through Title V Permit

16. Source testing when firing on LPG fuel need not be performed if the LPG fuel usage for this furnace does not exceed 100 hours during any one calendar year. A source test shall be performed within 90 days after this furnace exceeds 100 hours of operation, on LPG, on an annual basis. [District Rule 1081] Federally Enforceable Through Title V Permit

17. Source testing shall be conducted by a CARB-certified source testing contractor. Source testing shall be conducted using the methods and procedures approved by the District. The District must be notified 30 days prior to any compliance source test, and a source test plan must be submitted for approval at least 15 days prior to source testing. The results of each source test shall be submitted to the District within 60 days after the source test date. [District Rule 1081] Federally Enforceable Through Title V Permit

18. Source test conditions shall be representative of operations equal to or greater than 60 percent of the fuel use capacity for each furnace as stated in the Permit to Operate. [District Rule 4354, §6.4.2] Federally Enforceable Through Title V Permit

19. PM and PM10 source testing shall be conducted downstream of the electrostatic precipitator and the ceramic filter dust collector in the common stack. Furnaces #1, #2, #3, and #4 must operate simultaneously during source testing unless prior approval is obtained from the District. [District Rule 1081] Federally Enforceable Through Title V Permit

20. An annual Relative Accuracy Test Audit (RATA) shall be performed on the continuous monitoring system as outlined in 40 CFR Part 60 Appendix B. [District Rule 1080] Federally Enforceable Through Title V Permit

21. The owner/operator shall perform a relative accuracy test audit (RATA) as specified by 40 CFR Part 60, Appendix F (CGAs and RATAs) and if applicable 40 CFR Part 75, Appendix B (linearity and RATAs) at least once every four calendar quarters and annually within 30 days of the anniversary date of the initial test. The permittee shall comply with the applicable requirements for quality assurance testing and maintenance of the continuous emission monitor equipment in accordance with the procedures and guidance specified in 40 CFR Part 60, Appendix F. [District Rule 1080] Federally Enforceable Through Title V Permit

22. An exceedance of a NOx or SOx emission limit as indicated by the CEMS shall be reported by the operator to the APCO within 24 hours. The notification shall include 1) name and location of the facility, 2) identification of furnace(s) causing the exceedances, 3) calculation of actual NOx, CO and VOC emissions, and 4) corrective actions and schedules to complete the work. [District Rule 1080 and Stanislaus County Rule 108] Federally Enforceable Through Title V Permit
23. The operator shall notify the APCO no later than one hour after the detection of a breakdown of the CEMS. The operator shall inform the APCO of the intent to shut down the CEMS at least 24 hours prior to the event. [District Rule 1100] Federally Enforceable Through Title V Permit

24. The permittee shall submit a written report including copies of any Equipment Breakdown reports and/or pertinent variance decisions to the APCO for each calendar quarter, within 30 days of the end of the quarter, including: time intervals, data and magnitude of excess emissions, nature and cause of excess emissions (if known), corrective actions taken and preventive measures adopted; averaging period used for data reporting shall correspond to the averaging period for each respective emission standard; applicable time and date of each period during which the CEM was inoperative (except for zero and span checks) and the nature of system repairs and adjustments; and a negative declaration when no excess emissions occurred. [District Rule 1080] Federally Enforceable Through Title V Permit

25. Upon notice by the District that the facility's CEM system is not providing polling data, the facility may continue to operate without providing automated data for a maximum of 30 days per calendar year provided the CEM data is sent to the District by a District-approved alternative method. [District Rule 1080] Federally Enforceable Through Title V Permit

26. Results of continuous emissions monitoring shall be reduced according to the procedure established in 40 CFR, Part 51, Appendix P, paragraphs 5.0 through 5.3.3, or by other methods deemed equivalent by mutual agreement with the District, the ARB, and the EPA. [District Rule 1080] Federally Enforceable Through Title V Permit

27. Cylinder gas audits (GGAs) of continuous emission monitors shall be conducted quarterly, except during quarters in which relative accuracy and total accuracy testing is performed, in accordance with EPA guidelines. The District shall be notified prior to completion of the audits. Audit reports shall be submitted along with quarterly compliance reports to the District. [District Rule 1080] Federally Enforceable Through Title V Permit

28. Compliance with the conditions in the permit requirements for this unit shall be deemed compliance with District Rule 4201, Stanislaus County Rule 404, District Rule 4202 and Stanislaus County Rule 405. A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

29. Compliance with the conditions in the permit requirements for this unit shall be deemed compliance with District Rule 4801 and Stanislaus County Rule 407. A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

30. The requirements of District Rule 4301 and Stanislaus County Rule 408 were determined to not apply to this unit because the unit does not utilize indirect heat transfer. A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

31. The requirements of 40 CFR Part 60, Subpart CC were determined to not apply to this unit because the unit was constructed prior to the effective date in the regulation and has not been modified (according to the definition of "modified" in the regulation). A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

32. The requirements of 40 CFR Part 61, Subpart N were determined to not apply to this unit because the unit does not use commercial arsenic. A permit shield is granted from these requirements. [District Rule 2520, §13.2] Federally Enforceable Through Title V Permit

34. The amount of glass produced shall not exceed 352.1 tons during any one day. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

35. NOx emissions shall not exceed 1.4 pounds per ton of glass produced. This performance based limit is to enforce the NOx emission reductions granted by certificate number N-54-2. [District NSR Rule] Federally Enforceable Through Title V Permit

36. CO emissions shall not exceed 0.90 pounds per ton of glass produced. [District NSR Rule] Federally Enforceable Through Title V Permit
37. The VOC emissions shall not exceed 0.23 pounds per ton of glass produced. [District Rule 2201] Federally Enforceable Through Title V Permit

38. The combined SOx emissions from permit units N-1662-1, N-1662-2, N-1662-3 and N-1662-4, while producing glass with equal to or greater than 25% by weight mixed color cullet, shall not exceed 0.99 lb/ton of glass produced (over a rolling 30 day average). [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

39. The combined SOx emissions from permit units N-1662-1, N-1662-2, N-1662-3 and N-1662-4, while producing glass with less than 25% by weight mixed color cullet, shall not exceed 0.81 lb/ton of glass produced (over a rolling 30 day average). [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

40. The PM10 emissions, except during full or partial emission control system bypass episodes, shall not exceed 0.45 lb/ton of glass produced. [District NSR Rules 2201 and 4354] Federally Enforceable Through Title V Permit

41. The PM10 emissions, during full or partial emission control system bypass episodes, shall not exceed 0.71 lb/ton of glass produced. [District Rule 2201] Federally Enforceable Through Title V Permit

42. The amount of time that the furnace exhaust is not fully treated by a control device shall not exceed 144 hours per calendar year. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

43. The PM10 emissions shall not exceed 15,527 pounds during the first calendar quarter, 15,699 pounds during the second calendar quarter, 15,872 pounds during the third calendar quarter and 15,872 pounds during the fourth calendar quarter. These limits are to enforce the PM10 emission reductions granted by certificate number N-161-4. [District NSR Rule] Federally Enforceable Through Title V Permit

44. During furnace idling, NOx emissions shall not exceed 528.2 pounds in any one day. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

45. During furnace idling, CO emissions shall not exceed 352.1 pounds in any one day. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

46. During furnace idling, VOC emissions shall not exceed 88.0 pounds in any one day. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

47. During furnace idling, SOx emissions shall not exceed 387.3 pounds in any one day when producing glass with equal to or greater than 25% by weight mixed color cullet. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

48. During furnace idling, SOx emissions shall not exceed 316.9 pounds in any one day when producing glass with less than 25% by weight mixed color cullet. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

49. During furnace idling, PM10 emissions shall not exceed 176.1 pounds in any one day. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

50. The facility shall not use commercial arsenic as a raw material in the production process. [40 CFR Part 61 Subpart N] Federally Enforceable Through Title V Permit

51. The ceramic filter dust collector shall be maintained and operated according to manufacturer's specifications. [District Rule 2201] Federally Enforceable Through Title V Permit

52. The ceramic filter dust collector cleaning frequency and duration shall be adjusted to optimize the control efficiency. [District Rule 2201] Federally Enforceable Through Title V Permit

53. Material removed from the ceramic filter dust collector shall be disposed of in a manner preventing entrainment into the atmosphere. [District Rule 2201] Federally Enforceable Through Title V Permit

54. Replacement filters numbering at least 10% of the total number of filters in the ceramic filter dust collector shall be maintained on the premises. [District Rule 2201] Federally Enforceable Through Title V Permit

55. Devices to measure the primary and secondary voltage and current of the electrostatic precipitator shall be maintained in accordance with the manufacturer's specifications. [District Rule 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit
56. The specific power of the electrostatic precipitator shall be at least 70 milliwatts/acfm except during the bypass episodes allowed by this permit. [District Rule 2520, §9.3.2 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

57. The ceramic filter dust collector shall be equipped with a pressure differential gauge to indicate the pressure drop across the filters. The gauge shall be maintained in good working condition at all times and shall be located in an easily accessible location. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

58. During operation of the ceramic filter dust collector, the pressure differential gauge reading shall be 5 to 10 inches of water column. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

59. The permittee shall comply with the compliance assurance monitoring operation and maintenance requirements of 40 CFR Part 64.7. [40 CFR Part 64] Federally Enforceable Through Title V Permit

60. If the District or EPA determine that a Quality Improvement Plan is required under 40 CFR Part 64.7(d)(2), the permittee shall develop and implement the Quality Improvement Plan in accordance with 40 CFR Part 64.8. [40 CFR Part 64] Federally Enforceable Through Title V Permit

61. The permittee shall comply with the record keeping and reporting requirements of 40 CFR Part 64.9. [40 CFR Part 64] Federally Enforceable Through Title V Permit

62. The specific power of the electrostatic precipitator shall be continuously monitored and recorded. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

63. Dust collector filters shall be inspected annually while in operation for evidence of particulate matter breakthrough and replaced as needed. [District Rule 2520, 9.4.2] Federally Enforceable Through Title V Permit

64. Dust collector filters shall be inspected annually while not in operation for tears, scuffs, abrasions or hole that might interfere with the PM collection efficiency and shall be replaced as needed. [District Rule 2520, 9.4.2] Federally Enforceable Through Title V Permit

65. A daily record of the hours of operation, the amount of glass pulled from the furnace (in tons), the NOx emissions (in lb/ton of glass pulled), the SOx emissions (in lb/ton of glass pulled), the weight of mixed color mix cullet used, the total amount of cullet used (by weight) and the ratio of the mixed color cullet weight to the total cullet weight (in percent). [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

66. The oxygen to fuel ratio shall be continuously monitored and recorded. [District Rule 4354] Federally Enforceable Through Title V Permit

67. The permittee shall maintain daily records of the aggregated NOx emissions. [District Rules 2520, 9.3.2 and 4354, 9.6.1 and 9.7] Federally Enforceable Through Title V Permit

68. The permittee shall maintain the burner oxygen to fuel ratio records required by this permit. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

69. A record of the PM10 emissions from this unit, in pounds per calendar quarter, shall be kept. [District Rule 2201] Federally Enforceable Through Title V Permit

70. A record of the cumulative annual number of hours that the emission control system is either fully or partially bypassed shall be kept. The record shall be updated at least weekly. [District Rules 2201 and 4354] Federally Enforceable Through Title V Permit

71. The permittee shall maintain daily records of the specific power of the electrostatic precipitator (in milliwatts/acfm). [District Rules 2201, 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

72. The operator shall monitor and record the pressure differential gauge reading of the ceramic filter dust collector at least once during each day that the unit operates. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

PERMIT UNIT REQUIREMENTS CONTINUE ON NEXT PAGE

These terms and conditions are part of the Facility-wide Permit to Operate.
73. Records of dust collector maintenance, inspections and repairs shall be maintained. The records shall include, date of inspection, change outs of filter media, corrective action taken, and identification of the individual performing the inspection. [District Rules 2201 and 2520, 9.4.2] Federally Enforceable Through Title V Permit

74. All records shall be maintained and retained on-site for a period of at least 5 years and shall be made available for District inspection upon request. [District Rules 2201 and 4354 and 40 CFR Part 64] Federally Enforceable Through Title V Permit

These terms and conditions are part of the Facility-wide Permit to Operate.
APPENDIX III

Baseline Actual Emission Calculations for SB288 Modification Calculations
Baseline Actual Emissions Calculations for SB288 Modification Calculations

Determination of the Representative Baseline Period

The following table shows the furnace #2 glass production rate for the previous five calendar years, and the average annual glass production rate.

<table>
<thead>
<tr>
<th>Year</th>
<th>Glass Production (tons, glass pulled)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009</td>
<td>111,414</td>
</tr>
<tr>
<td>2010</td>
<td>97,552</td>
</tr>
<tr>
<td>2011</td>
<td>111,414</td>
</tr>
<tr>
<td>2012</td>
<td>115,393</td>
</tr>
<tr>
<td>2013</td>
<td>88,782</td>
</tr>
</tbody>
</table>

5-year Average Annual Glass Production: 104,911 tons

To choose a representative baseline period, the two-year period average annual glass production will be compared with the five-year average annual glass production. The two-year period with an average glass production closest to the above 5-year average annual glass production will be chosen as the representative baseline period. The following table compares the 2-year averages with the 5-year average.

<table>
<thead>
<tr>
<th>Baseline Period Candidates</th>
<th>2-year Candidate Baseline Period Average Annual Glass Production (tons/year)</th>
<th>5-year Average Annual Glass Production (tons/year)</th>
<th>Difference (tons/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009 &amp; 2010</td>
<td>104,483</td>
<td>104,911</td>
<td>-428</td>
</tr>
<tr>
<td><strong>2010 &amp; 2011</strong></td>
<td><strong>104,483</strong></td>
<td><strong>104,911</strong></td>
<td><strong>-428</strong></td>
</tr>
<tr>
<td>2011 &amp; 2012</td>
<td>113,404</td>
<td>104,911</td>
<td>8,493</td>
</tr>
<tr>
<td>2012 &amp; 2013</td>
<td>102,088</td>
<td>104,911</td>
<td>-2,823</td>
</tr>
</tbody>
</table>

A 2-year baseline period of 2010 and 2011 will be chosen as the baseline period that is most representative of normal operations for the purposes of determining the baseline emissions for SB288 Modification calculations.

Baseline Emissions for NOx from Glass Furnace #2

The facility has four furnaces that share an exhaust stack that is equipped with a NOx CEMS. The following table shows the total glass production from the four furnaces and the annual NOx emissions reported to the District for the calendar year, and an emission factor that is calculated by dividing the calendar year NOx emissions by the calendar year glass production.

<table>
<thead>
<tr>
<th>Calendar Year</th>
<th>NOx Emissions (lb)</th>
<th>Total Facility Glass Production (tons)</th>
<th>Emission Factor (lb-NOx/ton of glass)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010</td>
<td>389,920</td>
<td>450,235</td>
<td>0.87</td>
</tr>
<tr>
<td>2011</td>
<td>436,720</td>
<td>491,985</td>
<td>0.89</td>
</tr>
</tbody>
</table>
Furnace #2 baseline emissions will be calculated by multiplying calendar year baseline glass production by the emission factors presented in the previous table. The following table shows the results of this calculation, and the average annual NOx emissions during the baseline period.

<table>
<thead>
<tr>
<th>Calendar Year</th>
<th>Glass Production (tons)</th>
<th>EF (lb-NOx/ton of glass)</th>
<th>Annual NOx (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010</td>
<td>97,552</td>
<td>0.87</td>
<td>84,870</td>
</tr>
<tr>
<td>2011</td>
<td>111,414</td>
<td>0.89</td>
<td>99,158</td>
</tr>
<tr>
<td><strong>Average Annual Baseline NOx Emissions</strong></td>
<td></td>
<td></td>
<td><strong>92,014</strong></td>
</tr>
</tbody>
</table>

Therefore, the baseline actual emissions for NOx for SB288 Modification Calculations is 92,014 lb/year.

**Baseline Emissions for SOx from Glass Furnace #2**

The facility has four furnaces that share an exhaust stack that is equipped with a SOx CEMS. The following table shows the total glass production from the four furnaces and the annual SOx emissions reported to the District for the calendar year, and an emission factor that is calculated by dividing the calendar year SOx emissions by the calendar year glass production.

<table>
<thead>
<tr>
<th>Calendar Year</th>
<th>SOx Emissions (lb)</th>
<th>Total Facility Glass Production (tons)</th>
<th>Emission Factor (lb-SOx/ton of glass)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010</td>
<td>568,900</td>
<td>450,235</td>
<td>1.26</td>
</tr>
<tr>
<td>2011</td>
<td>432,920</td>
<td>491,985</td>
<td>0.88</td>
</tr>
</tbody>
</table>

The current permit requires the furnace to meet a SOx emission factor of 0.81 lb-SOx/ton when using less than 25% by weight mixed color cullet, and 0.99 lb-SOx/ton when using 25% by weight mixed color cullet, or more. Conservatively, baseline SOx emissions will be calculated using a SOx emission factor of 0.81 lb-SOx/ton.

Furnace #2 baseline emissions will be calculated by multiplying calendar year baseline glass production by 0.81 lb-SOx/ton emission factor. The following table shows the results of this calculation, and the average annual SOx emissions during the baseline period.

<table>
<thead>
<tr>
<th>Calendar Year</th>
<th>Glass Production (tons)</th>
<th>EF (lb-SOx/ton of glass)</th>
<th>Annual SOx (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010</td>
<td>97,552</td>
<td>0.81</td>
<td>79,017</td>
</tr>
<tr>
<td>2011</td>
<td>111,414</td>
<td>0.81</td>
<td>90,245</td>
</tr>
<tr>
<td><strong>Average Annual Baseline SOx Emissions</strong></td>
<td></td>
<td></td>
<td><strong>84,631</strong></td>
</tr>
</tbody>
</table>

Therefore, the baseline actual emissions for SOx for SB288 Modification Calculations is 84,631 lb/year.
Baseline Emissions for PM10 from Glass Furnace #2

The source test results shown in the following table will be used to calculate the baseline actual emissions for the furnace.

<table>
<thead>
<tr>
<th>Source Test Date</th>
<th>Emission Rate (lb-PM10/ton of glass)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4/22/2010</td>
<td>0.202</td>
</tr>
<tr>
<td>5/12/2011</td>
<td>0.059</td>
</tr>
</tbody>
</table>

Furnace #2 baseline emissions will be calculated by multiplying calendar year baseline glass production by the emission factors presented in the previous table. The following table shows the results of this calculation, and the average annual PM10 emissions during the baseline period.

<table>
<thead>
<tr>
<th>Calendar Year</th>
<th>Glass Production (tons)</th>
<th>EF (lb-PM10/ton of glass)</th>
<th>Annual PM10 (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010</td>
<td>97,552</td>
<td>0.202</td>
<td>19,706</td>
</tr>
<tr>
<td>2011</td>
<td>111,414</td>
<td>0.059</td>
<td>6,573</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Average Annual Baseline PM10 Emissions</strong> 13,140</td>
</tr>
</tbody>
</table>

Therefore, the baseline actual emissions for PM10 for SB288 Modification Calculations is 13,140 lb/year.

Baseline Emissions for VOC from Glass Furnace #2

The source test results shown in the following table will be used to calculate the baseline actual emissions for the furnace.

<table>
<thead>
<tr>
<th>Source Test Date</th>
<th>Emission Rate (lb-VOC/ton of glass)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4/22/2010</td>
<td>0.004</td>
</tr>
<tr>
<td>5/12/2011</td>
<td>0.005</td>
</tr>
</tbody>
</table>

Furnace #2 baseline emissions will be calculated by multiplying calendar year baseline glass production by the emission factors presented in the previous table. The following table shows the results of this calculation, and the average annual VOC emissions during the baseline period.

<table>
<thead>
<tr>
<th>Calendar Year</th>
<th>Glass Production (tons)</th>
<th>EF (lb-VOC/ton of glass)</th>
<th>Annual VOC (lb/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010</td>
<td>97,552</td>
<td>0.004</td>
<td>390</td>
</tr>
<tr>
<td>2011</td>
<td>111,414</td>
<td>0.005</td>
<td>557</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Average Annual Baseline VOC Emissions</strong> 474</td>
</tr>
</tbody>
</table>

Therefore, the baseline actual emissions for VOC for SB288 Modification Calculations is 474 lb/year.
APPENDIX IV

BACT Guideline 1.5.9 and Top-Down BACT Analysis
Top Down BACT Analysis for NOx, SOx, PM10, and VOC

I. BACT Analysis for Glass Furnace N-1662-2-17

BACT is required for NOx, SOx, and PM10 emissions.

a. Step 1 - Identify All Possible Control Technologies

The following control technologies have been identified in Rule 4320:

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Achieved in Practice or contained in SIP</th>
<th>Technologically Feasible</th>
<th>Alternate Basic Equipment</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOx</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and NOx emissions of &lt; or = 1.5 lb/ton of glass pulled</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and NOx emissions of &lt; or = 1.3 lb/ton of glass pulled</td>
<td>Electric Furnace</td>
</tr>
<tr>
<td>SOx</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and SOx emissions of &lt; or = 0.8 lb/ton of glass pulled when total cullet is &lt; 25% mixed color cullet, and SOx emissions of &lt; or = 1.1 lb/ton of glass pulled when total cullet is &gt; or = 25% mixed color cullet</td>
<td>–</td>
<td>Electric Furnace</td>
</tr>
<tr>
<td>PM10</td>
<td>Natural gas-fired furnace oxy-fuel furnace with an electrostatic precipitator in series with a semi-dry scrubber, using LPG backup fuel and PM10 emissions of &lt; or = 0.45 lb/ton of glass pulled</td>
<td>–</td>
<td>Electric Furnace</td>
</tr>
</tbody>
</table>
| VOC       | Natural gas-fired furnace with VOC emissions of < or = 0.2 lb/ton of glass pulled | 1. Natural gas-fired furnace with a catalytic oxidizer and VOC emissions of < or = 0.01 lb/ton of glass pulled (95% control efficiency)  
2. Natural gas-fired oxy-fuel furnace with LPG backup fuel, and VOC emissions of < or = 0.01 lb/ton of glass pulled (95% control efficiency)  
3. Natural gas-fired furnace with VOC emission of 3.4 ppmv at 15% O2 dry and VOC emissions of < or = 0.184 lb/ton of glass pulled (block 24-hour average) (8% control efficiency) | – |

The SOx emission limit in BACT Guideline 1.5.9 only applies when the mixed color cullet is less than 25% of the total cullet. It was determined in District Project N-1120773 that the Achieved in Practice BACT level for SOx is 1.1 lb/ton when the mixed color cullet is equal to or greater than 25% of the total cullet.
b. Step 2 - Eliminate Technologically Infeasible Options

There are no infeasible options. However, since this is a modification to an existing furnace, alternate basic equipment options are not evaluated. Therefore, the option of using an electric furnace will not be considered.

c. Step 3 - Rank Remaining Control Technologies by Control Effectiveness

NOx Emissions:

<table>
<thead>
<tr>
<th>Rank</th>
<th>Control Technology</th>
<th>Achieved in Practice</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and NOx emissions of &lt; or = 1.3 lb/ton of glass pulled</td>
<td>N</td>
</tr>
<tr>
<td>2</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and NOx emissions of &lt; or = 1.5 lb/ton of glass pulled</td>
<td>Y</td>
</tr>
</tbody>
</table>

SOx Emissions:

<table>
<thead>
<tr>
<th>Rank</th>
<th>Control Technology</th>
<th>Achieved in Practice</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and SOx emissions of &lt; or = 0.8 lb/ton of glass pulled when total cullet is &lt; 25% mixed color cullet, and SOx emissions of &lt; or = 1.1 lb/ton of glass pulled when total cullet is &gt; or = 25% mixed color cullet</td>
<td>Y</td>
</tr>
</tbody>
</table>

PM10 Emissions:

<table>
<thead>
<tr>
<th>Rank</th>
<th>Control Technology</th>
<th>Achieved in Practice</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Natural gas-fired furnace oxy-fuel furnace with an electrostatic precipitator in series with a semi-dry scrubber, using LPG backup fuel and PM10 emissions of &lt; or = 0.45 lb/ton of glass pulled</td>
<td>Y</td>
</tr>
</tbody>
</table>
VOC Emissions:

<table>
<thead>
<tr>
<th>Rank</th>
<th>Control Technology</th>
<th>Achieved in Practice</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Natural gas-fired furnace with a catalytic oxidizer and VOC emissions of &lt; or = 0.01 lb/ton of glass pulled (95% control efficiency) or Natural gas-fired oxy-fuel furnace with LPG backup fuel, and VOC emissions of &lt; or = 0.01 lb/ton of glass pulled (95% control efficiency)</td>
<td>No</td>
</tr>
<tr>
<td>2</td>
<td>Natural gas-fired furnace with VOC emission of 3.4 ppmv at 15% O2 dry and VOC emissions of &lt; or = 0.184 lb/ton of glass pulled (block 24-hour average) (8% control efficiency)</td>
<td>No</td>
</tr>
<tr>
<td>3</td>
<td>Natural gas-fired furnace with VOC emissions of &lt; or = 0.2 lb/ton of glass pulled</td>
<td>Yes</td>
</tr>
</tbody>
</table>

d. Step 4 - Cost Effectiveness Analysis

The applicant is proposing the most effective control technology for NOx, SOx, PM10 and VOC; therefore, a cost effectiveness analysis is not required.

e. Step 5 - Select BACT

BACT is the following:

<table>
<thead>
<tr>
<th>NOx</th>
<th>Natural gas-fired oxy-fuel furnace using LPG backup fuel and NOx emissions of &lt; or = 1.3 lb/ton of glass pulled</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOx</td>
<td>Natural gas-fired oxy-fuel furnace using LPG backup fuel and SOx emissions of &lt; or = 0.8 lb/ton of glass pulled when total cullet is &lt; 25% mixed color cullet, and SOx emissions of &lt; or = 1.1 lb/ton of glass pulled when total cullet is &gt; or = 25% mixed color cullet</td>
</tr>
<tr>
<td>PM10</td>
<td>Natural gas-fired furnace oxy-fuel furnace with an electrostatic precipitator in series with a semi-dry scrubber, using LPG backup fuel and PM10 emissions of &lt; or = 0.45 lb/ton of glass pulled</td>
</tr>
<tr>
<td>VOC</td>
<td>Natural gas-fired oxy-fuel furnace with LPG backup fuel, and VOC emissions of &lt; or = 0.01 lb/ton of glass pulled (95% control efficiency)</td>
</tr>
</tbody>
</table>

The applicant has proposed this level of control. Therefore, BACT requirements for NOx, SOx, PM10, and VOC are satisfied.

**Proposed Permit Conditions**

To ensure that human health risks will not exceed District allowable levels; the following permit conditions must be included for:

**Unit # 2-17**

No special conditions are required.

B. RMR REPORT

I. Project Description

Technical Services received a request on April 25, 2014, to perform an Ambient Air Quality Analysis and a Risk Management Review for the modification of a glass Furnace.
II. Analysis

Technical Services performed a prioritization using the District's HEARTs database. Since the total facility prioritization score was greater than one, a refined health risk assessment was required. Emissions calculated using Ventura County emission factors for Glass Furnace were input into the HEARTs database. The AERMOD model was used, with the parameters outlined below and meteorological data for 2005-2009 from Modesto to determine the dispersion factors (i.e., the predicted concentration or \( X \) divided by the normalized source strength or \( Q \)) for a receptor grid. These dispersion factors were input into the Hot Spots Analysis and Reporting Program (HARP) risk assessment module to calculate the chronic and acute hazard indices and the carcinogenic risk for the project.

The following parameters were used for the review:

<table>
<thead>
<tr>
<th>Analysis Parameters</th>
<th>Unit 2-17</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Type</td>
<td>Point</td>
</tr>
<tr>
<td>Stack Height (m)</td>
<td>42</td>
</tr>
<tr>
<td>Stack Diameter (m)</td>
<td>1.46</td>
</tr>
<tr>
<td>Stack Exit Velocity (m/s)</td>
<td>6.93</td>
</tr>
<tr>
<td>Stack Exit Temp. (°K)</td>
<td>613</td>
</tr>
<tr>
<td>Furnace throughput (PM10/yr)</td>
<td>9,629</td>
</tr>
</tbody>
</table>

Technical Services performed modeling for criteria pollutants CO, NOx, SOx and PM<sub>10</sub>, as well as a RMR. The emission rates used for criteria pollutant modeling were 0 lb/hr CO, 2.75 lb/hr NOx, 3.21 lb/hr SOx, and 2.3 lb/hr PM<sub>10</sub>. The engineer supplied the maximum fuel rate for the IC engine used during the analysis.

The results from the Criteria Pollutant Modeling are as follows:

<table>
<thead>
<tr>
<th>Criteria Pollutant Modeling Results*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diesel ICE</td>
</tr>
<tr>
<td>CO</td>
</tr>
<tr>
<td>NOx</td>
</tr>
<tr>
<td>SOx</td>
</tr>
<tr>
<td>PM&lt;sub&gt;10&lt;/sub&gt;</td>
</tr>
<tr>
<td>PM&lt;sub&gt;2.5&lt;/sub&gt;</td>
</tr>
</tbody>
</table>

*Results were taken from the attached PSD spreadsheet.

<sup>1</sup>The project was compared to the 1-hour NO2 National Ambient Air Quality Standard that became effective on April 12, 2010 using the District's approved procedures.

<sup>2</sup>The criteria pollutants are below EPA's level of significance as found in 40 CFR Part 51.165 (b)(2).
III. Conclusion

The acute and chronic indices are below 1.0 and the cancer risk associated with the project is greater than 1.0 in a million, but less than 10 in a million. In accordance with the District's Risk Management Policy, the project is approved with Toxic Best Available Control Technology (T-BACT).

To ensure that human health risks will not exceed District allowable levels; the permit conditions listed on page 1 of this report must be included for this proposed unit.

These conclusions are based on the data provided by the applicant and the project engineer. Therefore, this analysis is valid only as long as the proposed data and parameters do not change.

The emissions from the proposed equipment will not cause or contribute significantly to a violation of the State and National AAQS.

Re: Furnace 2 Rebuild

Dear Mark:

The following information is submitted to complete the application for an ATC for the repair of furnace 2.

Gallo Glass would like to pursue a short exemption from the emission limits of Rule 4354, according to Section 5.2.1, as follows:

- The time required to bring the furnace to operating temperatures on the primary combustion system is approximately 120 hours.
- The time required to fill the furnace and establish a glass pull is an additional 4 to 5 days.
- Time to hot seal the furnace and tune the combustion systems is an additional 7 to 8 days.
- Total maximum time the exemption would be necessary is 18 days.

If there is any additional information required, kindly call Dan Armagost or me.

Sincerely,

Julia Bonardi

APPENDIX VII

Quarterly Net Emissions Change
QNEC Calculations

QNEC = (PE2 − BE) ± 4

As shown in Section VII.C.5, BE is equal to PE1 for all pollutants. Therefore, the equation for QNEC reduces to:

QNEC = (PE2 − PE1) ± 4

N-1662-2-17
